DESCRIBE THE PRESENT AND ORIGINAL (IF KNOWN) PHYSICAL APPEARANCE

The present day Kennicott Grove consists of about 70 acres of woodland, marshland, and thicket, and of about 70 acres of open land within a triangle formed by Milwaukee Avenue, Lake Avenue, and the Chicago and Northwestern railroad tracks. There are approximately a dozen homes within the grove of which one is the Robert Kennicott House.

Historically Kennicott Grove was a typical example of a prairie grove. It consisted of about 250 acres of wooded, heavily vegitated land with several natural ponds. After Dr. John Kennicott moved to the grove in about 1837, he planted numerous fruit trees, laid out vegetable and flower gardens, and in other ways cultivated the grove.

The Robert Kennicott House was built in approximately 1856. The following architectural evaluation of the house, which applies today, was prepared in 1974.

The plan of the Kennicott house is unusual and without any very obvious governing principle. Original plans were not available during the examination and a sketch plan of the exterior and of the first floor were prepared for study purposes only. Copies of sketches will be available. Plans of this character are usually the result of gradual additions to an original core structure and remodelling from time to time. We are relatively certain that this was the case in the Kennicott house. sequence of growth can be, for the most part, only surmised at this early stage of examination. The Gothic room on the north is presumably the latest addition. Otherwise the house has three distinct parts: main rectangle, south room, and kitchen wing. Unless some research is done in family papers and other records, and/or by partially dismantling and probing in the building, it is unlikely that the order of construction can be determined exactly. The east wall of the south room is dated by inscriptions to earlier than 1878. The porch that surrounds that room appears to date from about 1920 judging from inscriptions on the shutters covering the inscribed siding of earlier date.

Besides the board and batten siding which is probably not original, the only destructive architectural details occur as patterns around the second floor windows and in the treatment of eaves. The vertical board and batten siding is rare in Illinois and gives the house a special architectural interest especially if it, or its original part, dates from as early as 1854.

Wilbert R. Hasbrouck, FAIA, and Paul E. Sprague, Ph.D., "Preliminary Evaluation of Kennicott Grove Property with Special Emphasis on the Structu Structure Known as the Kennicott House," in Open Lands Project, "A Proposal for Intergovernmental and Citizen Group Agreement for Acquisition, Development, and Maintenance of the Grove, (Chicago, 1974).

STATEMENT OF SIGNIFICANCE

Robert Kennicott, naturalist and explorer, was born November 13, 1835, in New Orleans. Shortly after Robert's birth the family moved to Northfield, Illinois, a small community eighteen miles north of Chicago. Robert's father, John Kennicott, was a physician who, like many doctors of the period, was also interested in natural history. After moving to Northfield the elder Kennicott turned his full attention to the study of horticulture and to promoting the agricultural potential of the region. In time he became a leading horticultural expert and also edited a periodical called "The Prairie Farmer." At his home in Northfield Dr. John Kennicott turned a typical prairie grove into a horticultural laboratory. He carefully classified the types of plants, flowers, trees, and vegetables in the grove.

Robert Kennicott grew up surrounded by the concerns of science and especially natural history. Sickly as a child he did not attend the local schools but rather his father educated him at home. From his youngest days Robert explored the grove with his father studying its varied flora and fauna. He also talked with the visitors who came to the grove to talk with his father about natural history and horticultural subjects. Kennicott was eighteen he had explored a large section of northern Illinois and had made a large collection of natural history material. His observations on the quadrupeds and birds of the region attracted the interest of Dr. J. E. Kirtland, a Cleveland naturalist and a friend of Dr. John Kennicott. In 1852-53 Robert studied with Kirtland in Cleveland. Kirtland advised him to begin corresponding with Spencer Baird of the Smithsonian Institution and to send him papers on natural history subjects. Robert sent Baird a paper on the results of experiments on the effects of rattlesnake venom on animals. The paper was subsequently published in the "Smithsonian Reports."

In 1854 Robert went to Racine, Wisconsin, to study ornithology with Dr. P. R. Hoy, the leading amateur ornithologist in that region of Wisconsin. In 1855 Kennicott conducted a natural history survey of southern Illinois for the State Agricultural Society and the Illinois and Central Railroad. Some of his earliest papers described material collected during this survey. In 1856 Kennicott went back to Chicago and started attending lectures on medicine. At the same time he joined with others to found the Chicago Academy of Sciences. Midway through the year Kennicott became sick and was

This is because of Downing and Davis' interest in the board and batten exterior during the years around 1850. It may be that the design, or concept, at least, came from one of Downing's pattern books. It is also a strong possibility that Downing actually was involved in the design of the original structure in view of his personal relationship with Dr. John Kennicott. The main block of the house seems a bit boxey and over-scaled, however, for a genuine Davis-Downing design. The relation of dormer to roof, batten size, and mass seems more akin to the 1850's in the south wing and interior wing. Again, a detailed historical study and interior probing inspection could probably answer these questions.

forced to return to his home in Northfield. By 1857 he had recovered and, when Northwestern University asked him to make a collection of botanical and zoological material to establish a museum of natural history at the university, Kennicott accepted. Kennicott next spent the winter of 1857-58 at the Smithsonian Institution classifying and describing the material he collected for Northwestern. The following summer he again collected in the field and again spent the winter in Washington. This time his material went to the University of Michigan.

In 1859 Kennicott, supported by the Smithsonian and the Audubon Club of Chicago, made his first trip to northern Manitoba and western Ontario. This expedition lasted three years and Kennicott collected a very large amount of material. In 1862 he returned to the Smithsonian and spent the winter studying the collections. In that Chicago residents had helped finance the expedition, the Chicago Academy of Sciences received a part of the collection. In 1864 Kennicott transfered the collection to Chicago and was appointed its curator and a trustee of the academy.

In 1865 the Western Union Telegraph Company decided to construct a line that would cross the Bering Strait thus linking North America with Russia and Europe. Kennicott, who had acquired experience in exploring in the North, was chosen to lead one of the parties that was to survey a possible route up the Yukon. In addition the party was to collect natural history data and explore for natural resources. In 1866 Kennicott began his exploration of Alaska and explored much of the Yukon River. In May 1866, while making triangulations at the small Russian village of Nulato, Kennicott suffered a heart attack. On May 13, 1866, he was found face down on the shore of the Yukon with his compass nearby and bearings to the local peaks traced in the sand. Kennicott was dead at the age of 30.

Robert Kennicott's name does not stand in the first rank of American scientists. Although he published numerous papers on natural history subjects, he made no original contributions to knowledge. He is remembered as having helped convince the American government to purchase Alaska and also as an explorer, but as a scientist he was not a nationally significant figure. Robert Kennicott's significance in the history of science in America is twofold. First, his scientific activities illustrate an important aspect of scientific activity in the United States during the first half of the 19th century, and, second, as a founder of the Chicago Academy of Sciences Kennicott contributions document the manner in which scientific institutions and methods were carried to the Midwest.

During the first half of the 19th century the principal concern of American science was the study of natural history. From Jefferson's Lewis and Clark expedition through the Wilkes expedition to the great railroad surveys and the State geological surveys, the major interest of American science focused on collecting, identifying, and describing the natural phenomena of the North American continent. 1 To accomplish this objective botanists, zoologists, ornithologists, geologists, paleontologists, and their colleagues accompanied the various expeditions making collections which they described after returning to the East. At the same time amateur naturalists, usually doctors or men of means, who lived in the frontier territories also studied natural history in their regions. Adopting the methodologies of their eastern peers they spread out making collections of flora and fauna and recording strata and uplifts. They dutifully sent east the data they gathered to institutions such as the Smithsonian. In his collecting activities in Illinois Robert Kennicott illustrates this type of scientific activity. He did not attend a prominent eastern college or university and was largely self taught, nor did he travel to Europe as did his prominent Eastern peers. But after learning methodology at the Smithsonian he explored in the old Northwest, Canada, and Alaska and sent his collections to the Smithsonian. Kennicott, and an unknown number of naturalists like him, helped fill in the natural history details of frontier America and thus contributed to science in America during the mid-19th century.

When Dr. John Kennicott moved to the Chicago area in 1836 or 1837, there were no scientific institutions. His home at todays Kennicott Grove became a center for the concerns of science. His son Robert grew up to become "Chicago's First Naturalist." When in 1856 Robert Kennicott and like minded Chicago citizens established the Chicago Academy of Sciences, their act represented the establishment in the Midwest of an institution that could trace its intellectual ancestory to the Philadelphia Philosophical Society or the Boston Academy of Arts and Sciences. As the institution grew it together with the young colleges in the area began disseminating scientific knowledge in the region, thus, first, joining the Midwest to the mainstream of American culture, and, second, helping to transform the

region from frontier to an area of civilization and culture. Although Robert Kennicott was not an outstanding scientist, he and the house he occupied illustrate how science was pursued in the Midwest during the mid-1800's and how scientific institutions were established. He, thus, illustrates an important element in the total picture of the history of science in America.
