DESCRIBE THE PRESENT AND ORIGINAL (11 known) PHYSICAL APPEARANCE

The Blackstone Canal was designed to connect Providence, Rhode Island, and Worcester, Massachusetts-forty-five miles apart-for the transport of commercial good, primarily, and also of passengers. It was constructed during the years 1824--1828. In northern Rhode Island it partly parallels and partly combins with the Blackstone River and in Providence becomes a part of the Moshassuck River. Twenty or more feet wide throughout, it was where necessary stone-walled, both to contain the canal stream and to support the path required for horses towing the canal-boats. Because of a drop of 451 feet in altitude from Worcester to Providence, granite-walled locks had to be constructed at numerous points, but little visibly remains of these locks--now, only outside Providence--and nothing of their mechanisms.

From the intact Lincoln, Rhode Island, portion of the canal (already a separate nomination to the National Register), it flows under the Front Street Bridge in that town, through Scott Pond and--now--beneath the Sayles Finishing Plant, next combining with the Moshassuck River channel. Thence it continues southward for four and one-half miles under new streets and past mill complexes to Interstate Route 95, within the Providence area. In this section there are no remains of walls or towpaths. South of Route 95, however, the canal retains its original granite walls--at least on the eastern tow-path side and often on both-for almost the entire remainder of its course into the city of Providence. This is now about one and one-half miles, terminating at the intersection of Steeple and Promenade Streets. In its time of use the canal ended finally at Market Square, some blocks south, where there was landing, a stair and a shelter for the transfer of passengers and cargo. These last stretches and the basin end of the canal are now covered by a network of modern pavements and squares.

The remaining Rhode Island sections of this canal display various types of stone wall construction, both with and without mortar. In most places they have maintained themselves sturdily; in others they have sometimes been repaired or rebuilt. Their general condition appears good. As one exception in Providence, there are remains of what once might have been a set of locks above Mill Street, for such were shown in and early survey. The canal remains a long finger through a good part of Providence, and it still flows.

STATEMENT OF SIGNIFICANCE (Include Personages, Dates, Events, Etc.)

The Blackstone Canal was at its beginnings (thought of in 1823, opened for use in 1828) another with many canals being stretched throughout the eastern United States. In the first third of the XIX Century occurred what might be called a frenzy of canal-building, induced by swift industrial and commercial development and the consequent need for a transportation network. All are familiar with the Erie Canal; there were also the Chesapeake and Delaware, the Philadelphia State, the Chesapeake and Ohio, the Louisville and Portland, the Morris-Delaware and Raritan, the Georgetown etc. The Blackstone Canal justifiably takes a place among them in national history, and in Rhode Island it certainly takes a notable place in local history.

Here, its functions were to assist in commerce between Providence and Worcester and to stimulate the industrial development of intervening towns and villages along the Moshassuck and Blackstone Rivers. These it did during its useful life of about twenty years, ended by the introduction of a Providence-Worcester railroad. It had forty-nine locks, as well as "tow-paths, basins, dams, wharves, embankments, toll houses, and other necessary appendages" demonstrative of the engineering and building skills of the times. Its Rhode Island management was in the hands of a corporation which had been formed by such prominent citizens as Edward Carrington, Stephen H. Smith and Moses B. Ives. Another corporation financed and managed the construction and operation of the canal's Massachusetts portions.

In Rhode Island there are still many parts of the canal visibly intact (while in Massachusetts there remain only a few vague and swampy evidences of its existence at all). In these sections we have historically valuable survivals of the engineering and transportation ambitions and technology of the 1820's. We can see the masonry retaining walls, variously built, some tow-paths and wharfage areas, and the path of the canal into the centre of Providence. In many northern parts of the

city--a section not lately noted for its beauty but scheduled for improvement--segments of the canal with water still flowing, railed and sometimes overhung by trees, provide almost the only, alive, picturesque thing to be seen and watched.

In many cities "pocket parks" of green have lately been created. In the remains of the Blackstone Canal, Providence has pocket streams of running water between ruggedly handsome old masonry. They are interesting now to discover; in future, freed of débris, they can form even more plleasurable accents in developed areas. Above all, they should be kept as visible and tangible parts of the city's and the state's history of growth, planning, commercial ambition and prosperity.

The stretch of the Blackstone Canal beginning at Front Street in Lincoln and extending four miles north to the Ashton Dam somprises the Paul Ronci Memorial Park. It is the longest segment of the original forty-five mile canal still intact. Both the canal and the tow-path exist in good condition. There are no locks or engineering structures along this stretch of the canal. The width of the canal varies between thirty-two and forty-five feet at the top. The bottom width is eighteen feet. Present water level averages between three and four feet in depth.

The land for use as a park includes the canal, tow-path, and fifteen feet on either side of the canal. The canal banks have a ground cover of brush and small-to-medium-size trees. The walls of the canal for the last two thousand feet at the northern end are lined with cut-stone blocks. The physical appearance to-day is, in short, much the same as it was during the years 1828 to 1848 when the canal was in use, transporting goods between Providence, Rhode Island, and Worcester, Massachusetts.

STATEMENT OF SIGNIFICANCE (Include Personages, Dates, Events, Etc.)

The canal was constructed between the years 1824 and 1828. It linked the cities of Worcester, Massachusetts, and Providence. The forty-five-mile stretch, with a drop of 451 feet in altitude, employed granite locks. The canal was not built as one independent and continuous stretch for its entire length, as it utilized the parallel Blackstone River at various points, thus saving some construction costs.

Built at the height of the canal frenzy, the Blackstone had a life of nearly twenty-five years--few of them prosperous. To begin with, it was too late in coming. John Brown of Providence had seen the advantages of such a canal opening up country markets for Providence trade in the late 1700's; but when his fellow-merchant, Edward Carrington, brought that vision to realization in the 1820's the coming of the railroad already heralded a faster and better way of moving goods and passengers. In addition, the canal project was underfinanced. Also, hasty planning had failed to provide a proper system of reservoirs to maintain a continuous water level; droughts and diversions of water by mill-owners resulted in frequent interruptions of service.

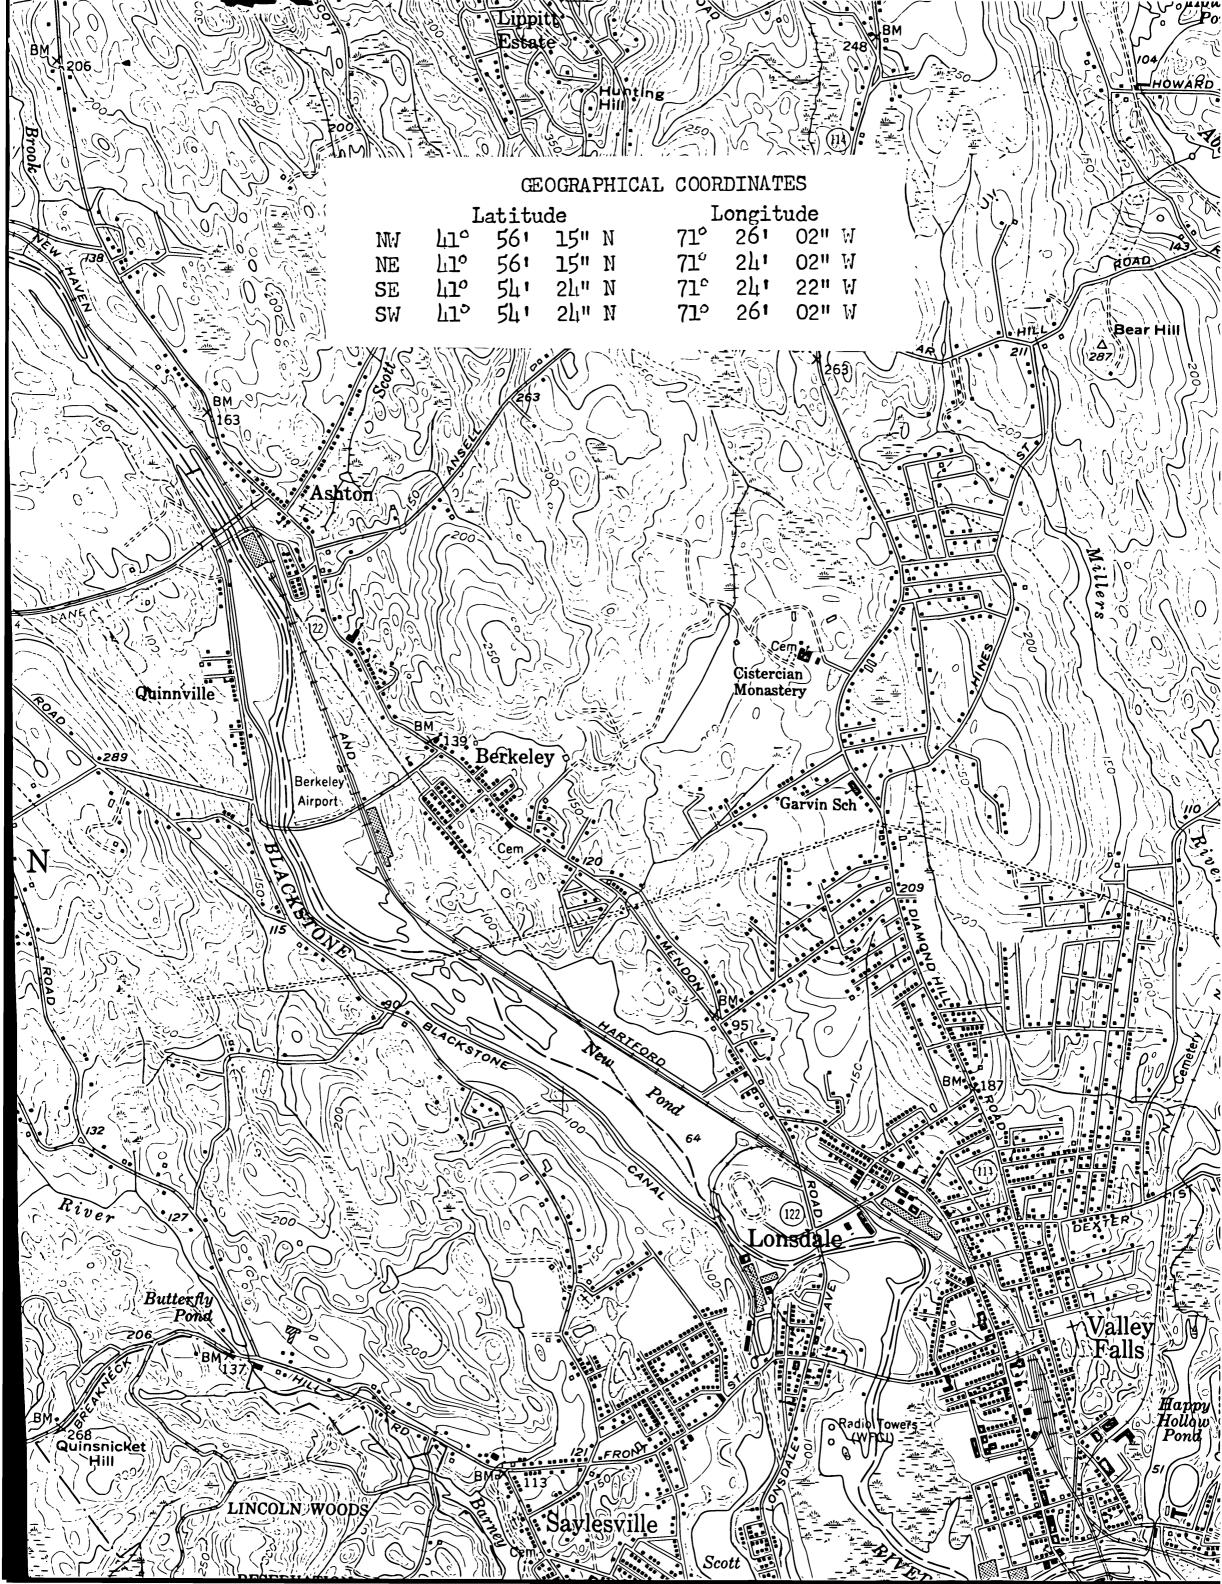

To-day few sections of the canal remain. There are no known locks still to be seen, though some of their remains may exist. In several places in Massachusetts the canal has been filled in. The canal bed in Rhode Island, however, is largely intact.
