National Register of Historic Places Registration Form

This form is for use in nominating or requesting determinations for individual properties and districts. See instructions in National Register Bulletin, *How to Complete the National Register of Historic Places Registration Form*. If any item does not apply to the property being documented, enter "N/A" for "not applicable." For functions, architectural classification, materials, and areas of significance, enter only categories and subcategories from the instructions.

1. Name of Property

Historic name: Wardenclyffe Laboratory

Other names/site number: _____

Name of related multiple property listing:

N/A

(Enter "N/A" if property is not part of a multiple property listing)

2. Location

Street & number: 56 NY-25A

City or town: Shoreham State: NY County: Suffolk

Not For Publication: Vicinity:

3. State/Federal Agency Certification

As the designated authority under the National Historic Preservation Act, as amended,

I hereby certify that this x nomination ___ request for determination of eligibility meets the documentation standards for registering properties in the National Register of Historic Places and meets the procedural and professional requirements set forth in 36 CFR Part 60.

In my opinion, the property x meets ___ does not meet the National Register Criteria. I recommend that this property be considered significant at the following level(s) of significance:

X national ___ statewide ___ local

Applicable National Register Criteria:

___A XB ___C ___D

<u>Roy Daniel Muey</u>	<u>6-14-2018</u>
Signature of certifying official/Title:	Date
<u>DSYPO</u>	
State or Federal agency/bureau or Tribal Government	

In my opinion, the property ___ meets ___ does not meet the National Register criteria.	
Signature of commenting official:	Date
Title :	State or Federal agency/bureau or Tribal Government

Narrative Description

(Describe the historic and current physical appearance and condition of the property. Describe contributing and noncontributing resources if applicable. Begin with a **summary paragraph** that briefly describes the general characteristics of the property, such as its location, type, style, method of construction, setting, size, and significant features. Indicate whether the property has historic integrity.)

Summary Paragraph

Wardenclyffe is located at 56 NY 25A in the hamlet of Shoreham within the Town of Brookhaven in Suffolk County, on the north shore of Long Island. Located on east central Long Island, Brookhaven is the only Town in Suffolk County that extends from the north shore to the south shore. Shoreham is situated on the north shore on the northwestern edge of the town. State Route 25A runs along the southern edge of the community and is home to most of its businesses and institutions. The area between the north side of Route 25A and Long Island Sound is characterized by wooded, suburban residential development. Wardenclyffe is located on a 16.43-acre site at the intersection of Randall Road and Route 25A.

The focus of this nomination is world famous scientist Nikola Tesla's laboratory at Wardenclyffe, where he worked from 1902 until 1906. During Tesla's period of occupation, the property was an open, 200-acre site containing his classical revival lab building and a 187-foot high transmission tower, both designed by architects McKim, Mead and White. Several decades

Wardenclyffe Laboratory

Name of Property

Suffolk, NY

County and State

after Tesla's use of the site, it was subdivided and developed for other industrial uses. Today, the lab survives intact amidst additions and non-historic buildings. The tower was destroyed soon after Tesla lost the property, but its foundation remains. Both resources retain sufficient integrity to represent Tesla's important contributions to science.

The site is characterized by a combination of woods, lawns, and buildings, including Tesla's Wardenclyffe Laboratory, the ruin of his tower, and buildings remaining from its later use by manufacturers Peerless Photo and the Agfa Corporation. The site is most visible from NY Route 25A, a heavily traveled road which forms the southern boundary of the site. From here, passersby get a good view of Tesla's Laboratory, which is set back toward the rear of the property. A statue of Tesla erected in 2013 and the foundations of his great tower are further south, closer to the road. The other buildings on the site are generally obscured from public view by patches of woods. The most densely built part of the site is the northeast corner, the location of Wardenclyffe Laboratory and the series of additions constructed after Tesla's ownership by Peerless and Agfa to transform the building into its production facility. The foundation of Tesla's tower and his statue are located in the southeast corner of the site. The other primary, non-historic, buildings on the site, the Bauer House, Administration Building, and Industrial Wastewater Treatment Facility, are located to the southwest of the laboratory. The northwest corner of the site and area along Randall Road is heavily wooded.

Narrative Description

During Nikola Tesla's ownership of the site, from 1901 to 1915, Wardenclyffe consisted of an approximately 200-acre site of mostly open fields, a one and one-half story classical revival industrial brick building with an east-west oriented gabled roof (approximately 95' by 95'), which served as a laboratory, office, and power house, and a 187' high transmission tower located to its south. The laboratory and tower were both designed by the architectural firm McKim, Mead & White. A spur of the Long Island Railroad formed the northern boundary of the site and a railroad siding delivered coal to the eastern side of the building. The site had been used for agriculture and was relatively flat and treeless in the immediate vicinity of the laboratory and tower. The tower was demolished for scrap in 1917; only its 90-foot-wide octagonal stone and concrete foundation remains.

Today, the laboratory and tower site are located on a parcel of approximately 16 acres. Land outside of that parcel has been subdivided and developed and no longer retains integrity. A fence secures the boundary of the site; a gate into the property is located on Randall Road. This is the same entrance used during Tesla's occupation of the site, when a road led directly to the center of the laboratory's west elevation. The edges of the site are now covered by wooded and lawn areas, and asphalt-paved parking lots fill much of the central portion of the site. Between 1915,

Wardenclyffe Laboratory

Name of Property

Suffolk, NY

County and State

when Nikola Tesla deeded over the property to his creditors, and 1938, when the site was purchased by Posi-Print to be redeveloped for use as a photograph emulsions manufactory, the property was abandoned and the site began to fill-in with shrubs and small trees. The existing plantings relate primarily to its mid and late-20th century development and include some ornamental trees and shrubs.

Beginning with the renovations of 1938-39, the original laboratory building began to be expanded with additions and buildings were constructed to the north and west of the original laboratory building. By 1984, when the last of these additions were constructed, nearly all of these components were interconnected with the lab. The only freestanding buildings in the vicinity of the original laboratory are the Boiler House, which is located on the western side of the laboratory and dates to circa 1939; a ca. 1940 Volatile Materials Storage Building, a Maintenance Shed located on the east side of the building; and a ca. 1970 Air-handling building located in an interior courtyard.

Other buildings on the site include the Bauer House, Administration Building, Industrial Wastewater Treatment Facility, and Guard Shack. The Bauer House is located on the east side of the property facing NY-25A. This house was constructed as a private residence circa 1920s on land subdivided from the Tesla acreage and was purchased by Agfa Corp. in 1978. It was subsequently used as an employee break room. The Administration Building is located just west of the Bauer House but is oriented facing north onto a large asphalt-paved parking lot. The Administration Building and parking lot were constructed between 1976 and 1980. The Industrial Wastewater Treatment Facility is located northwest of the Administration Building. The eastern section of the building was constructed in 1979 and the center and northern sections were completed between 1980 and 1985. The Guard Shack is located at the Randall Road entrance and is a non-historic building. The resource list is organized to describe the contributing resources first and then the non-contributing resources in chronological order. All resources are labeled and numbered on the site plan (See Section 9).

Contributing Resources

1. Wardenclyffe Laboratory/Powerplant – 1 Contributing Building; built 1901-1902, altered 1939-1984

The most important resource on the property and the subject of the nomination is the Wardenclyffe Lab, which was the site of Nikola Tesla's most advanced experiments in wireless power transmission and is the only remaining laboratory associated with this important scientist. Despite additions built onto the north, east, and west sides of the original Wardenclyffe laboratory between 1939 and 1984, the laboratory survives with substantive integrity to represent

Wardenclyffe Laboratory

Name of Property

Suffolk, NY

County and State

Tesla's period. The form and massing of the building survives and is visible. Two of the four exterior brick walls can be seen from the exterior, and the others remain evident on the interior. The vast majority of its original roof framing, cupola, center chimney, and a number of original arched windows are intact. In places where the windows have been boarded up or filled in, the arches marking the openings survive, including keystones. The original Neoclassical design, characterized by a balanced and symmetrical organization of spaces on all four elevations, is entirely readable.

While the interior has been subdivided with numerous wood partitions, the original interior floor plan is still readable (See Figures 1 & 2; original walls are shown in red). In addition to changes within the lab, a series of additions postdating Tesla's ownership were added onto the exterior of the building, all of which are interconnected on the interior. Although the enlarged and interconnected resource is one contributing building, it is described as two separate sections for clarity only; the laboratory is described completely first, and a description of the additions follows.

Exterior

The original Tesla Laboratory is a one and one half story, roughly 9-bay by 9-bay brick building with a side-gabled roof. The original building is nearly square in plan, measuring 95' on all sides. A brick, hipped-roof dormer is located in the center of the roof; a tapered square chimney rises from the dormer, extending to a height nearly double that of the building. The building mass is bilaterally symmetrical in plan, on both axes. The south and north elevations were designed to be identical, as were those on the east and west. Each elevation has a large, central arched doorway that is immediately flanked on either side by individual rectangular window openings. This is flanked on both sides by four bays of equally sized arched window openings. The building retains this original pattern even though some of the openings on exterior walls have been boarded up; however, many retain part or all of their original windows behind the coverings.

The façade (south elevation) is the only completely exposed elevation. Although the arched outlines and keystones remain, the first four window openings on the west half of the south façade have been infilled with concrete block. The sills were removed from the second and third window; and a metal frame door was installed at the second window bay. The original center axis door opening has been infilled with brick and a sill to match the adjacent window sills but is clearly identifiable as an entrance. The windows on the eastern half of the south façade remain partially intact. The easternmost windows have existing window frames.

The east and west elevations have gable ends and have a similar distribution of openings, bays, and proportions. The center section of the gabled wall projects approximately one foot further

Wardenclyffe Laboratory

Name of Property

Suffolk, NY

County and State

than the north and south sides of the same building elevation. The dominant arched doorway opening was located on center in these walls. Immediately flanking it on both sides were rectangular window openings; farther beyond that, on both sides, were three sequential arched window openings. These window openings are wider than their counterparts on the north and south facades.

The original east elevation is partially obscured by additions. The first two bays of original arched windows remain partially intact. Window frames and sash remain in their original locations. The third arched opening is infilled with concrete block. A rectangular doorway with a steel lintel partially fills the historic opening. The west elevation is also enclosed within a later addition. A small portion of the wall was removed in 1939 to accommodate industrial processing equipment. The seven remaining window openings have been infilled with concrete block. A new center door opening with a steel header was created slightly north of the original. A second opening in the wall was created farther south to access an interior corridor. The north elevation is entirely enclosed by additions. The original brick wall remains; however, the eleven original window openings have been infilled with concrete block. A new door opening with a steel lintel was installed between the original second and third window openings. Much of the original rowlock headers, stone sills, and bluestone base molding remain intact beneath layers of paint.

The dormer, which has a hipped roof that is perpendicular in plan to the main roof, remains intact. The ridge beam of the dormer's hipped roof is oriented north-south. The dormer has three rectangular windows underneath the roofline on each of its north and south elevations. A large tapered brick chimney projects from the center of the dormer. It was historically capped by a cast-iron cresting. The cresting was recently removed and restored and is now in protective storage awaiting reinstallation. Both the main roof and the dormer roof were originally built-up roofs with a gravel surface. These were supported by beaded tongue and groove planks supported by open web steel joists. The original roof sheathing and framing remain intact; however, the original roofing has been replaced with modified bitumen roofing.

Interior

The floor plan in the c. 1901, Tesla-era configuration, was defined by two large, rectangular volumes in the north and south bays and two additional large volumes, on each side of the center core, to the east and west. Each of these spaces was a double-height, floor-to-ceiling room. Principal bearing walls define the perimeter and the three dominant bays; collectively, with additional interior bearing walls, they form a square core at the center of the plan. The square chimney is positioned at the center of the plan and is supported by these bearing walls. Despite later reversible subdivisions and alterations, the configuration of the original Tesla-era brick bearing walls remains almost completely intact to its original, c. 1901 design and construction.

Wardenclyffe Laboratory

Name of Property

Suffolk, NY

County and State

The large, double-height spaces east and west of the center core accommodated Tesla's need for large laboratory and mechanical equipment. Tesla housed a very large boiler on the east. The "Dynamo Room," to the west, appears to have been a slightly more formal, perhaps even a reception space, with two bilaterally symmetrical grand stair cases, an array of impressive tools and equipment, and an elegant spiral stair at center axis, which provided access to a tunnel below. The Dynamo Room was on direct axis with the access road and was thus the "front door," or primary entrance of the building. Each of these rooms was flooded with natural light from skylights above (no longer extant) from and the large sliding doors located on the center axis of each elevation. The southern bay served as a "laboratory" and display area according to historic photos and Tesla's deposition in his 1922 foreclosure appeal.¹ It was, again, one large space which extended from the slab to the roof. It was flooded with light from windows on the east, south, and west sides. Additional central skylights at the east and west ends provided ample natural light. A nearly identical space, mirrored in plan, occupied the entire north volume. This was Tesla's "Machine Shop," where he also had two wood-frame construction balconies.

Subsequent to Tesla's occupation of the laboratory, many years went by before the next tenant took ownership of the space. In 1938, the Peerless Photo Corporation took ownership of this building, and it is evident that it immediately made changes to the interior, especially to the second floor. Over the course of the 20th century, the laboratory's open spaces were divided into numerous individual spaces within the framework of the original plan (See Figures 1 & 2). These, in turn, were modified, renovated, and redecorated. The current status of the building reflects approximately 60 years of occupation by photo processing companies. Nevertheless, these subdivisions minimally disrupt the original plan and are reversible.

On the first floor, in the south bay, the dominant axis and circulation route were modified. A doorway was introduced to the second bay window, from the east. The zone in the southeast corner became a series of smaller administrative offices. An entry vestibule, foyer, and stair were introduced, and the space was divided into offices. A north-south oriented hall leads to a dominant corridor, which lies east-west in plan, at the top of the south bay. The remainder of this south bay, to the west, was formerly occupied by industrial processing spaces.

A north-south oriented hallway lies in plan between the west center core interior bearing wall and the chimney. It historically and currently connects the north and south bays. To the west of this hallway are two masonry openings which lead to the former Dynamo Room. This space, lying west of the center core in plan, is now subdivided into a series of several larger and smaller rooms. A circulation path connects through the former Dynamo Room.

¹ "Wardenclyffe Foreclosure Appeal Proceedings" in *Nikola Tesla on His Work with Alternating Currents and the Application to Wireless Telegraphy, Telephony, and Transmission of Power*, ed. Leland Anderson (Breckinridge, Co: Twenty First Century Books, 2002).

Wardenclyffe Laboratory
Name of Property

Suffolk, NY
County and State

The original north bay has also been subdivided into a series of spaces, most of which seem to have served an industrial processing function. In the late 1930s, industrial equipment was installed for the photo processing companies. A portion of the northwest corner of the original masonry walls was removed to provide visual and physical access to the processing space to the north and west. All original window and door openings on the north façade have been infilled with concrete block. The industrial processing equipment extends east toward the northeast corner of the original building footprint. There are a series of modifications to the original east elevation. At the center bay, the original entrance to the Boiler Room has been infilled. A new circulation opening was created within the third window bay from the south, in the south bay. Most of the original window and door openings on the east façade have been altered. The only original windows on this elevation remain in the first window bays to the south.

In the late 1930s, a second floor was defined in the open volumes and stairs were constructed to access this space. Historic brick bearing walls define the upper floor, dividing it into three principal volumes. The north and south bays' floor levels are both slightly lower than that of the center bay and core, where new floors were built to align with a small, Tesla-era second-story section. Peerless constructed several offices and interior partitions on this upper floor. Physical evidence suggests that the earliest office spaces (c. 1930s) were constructed in the southeast and northeast corners. East side of the center bay, evidence from extant ceiling framing suggests additional wall partitions which also divided early administrative spaces.

It is likely that Peerless began some sort of industrial process function soon after it occupied the Tesla Laboratory in the 1930s. A great majority of the square footage of the second floor built by Peerless always served a mechanical function. The south bay remains broad and open and has experienced minimal to no intervention. Early partitions which divide this space from the hall (at the north) and a wire-screen partition divides it into two parts. Much of this mechanical "attic" space may have been part of the early 1930s Peerless interior fit-out. The north bay is similarly vast and occupied by mechanical and electrical equipment. The door which accesses the space from the center bay (east) is c. 1940. There's an attic partition wall, running north-south, just beyond that access door which was likely installed c. 1960 to accommodate electrical boxes.

The center, interior bay is divided in half by the vertical core. An assembly of offices is located east and west of this core. These were installed piecemeal over time to accommodate administrative needs. The offices to the west and the office at center east were all installed at the same time and subsequent to the original 1930s renovation. These offices underwent several interior renovations and reconfigurations, much of which may have happened in the 1960s.

Suffolk, NY

County and State

1A – 1P. Attached Additions; Built 1939 – circa 1984

Peerless Photo and its successor, Agfa Corporation, constructed numerous buildings and additions from 1939 until approximately 1984; some were originally built as separate, freestanding buildings and were subsumed into the larger factory building as a result of later additions. All of these additions are *internally connected* to the Wardenclyffe Laboratory. Due to their interconnections and complexity, these additions are counted along with the Tesla lab as one building; they have been described separately here for clarity only.

All of these additions, with the exception of the addition labeled “N” located on the west side of the laboratory, are one-story industrial and warehouse buildings with concrete slab-on-grade floors, concrete block walls, and shallow pitched built-up or modified bitumen roofs. Roof framing systems include both wood joists with wood decking, and steel bar joists with metal decking. The addition labeled “D” has a bowed wood truss roof structure with wood purlins and decking. Due to the light-sensitive nature of the photographic products being manufactured, there are very few windows anywhere in the building. Loading docks with depressed approaches were located at additions labeled “C”, “G”, “N”, and “P.” Addition “N” was constructed between 1976 and 1980 and is a reinforced concrete frame structure with an exterior sheathed in insulated vertical metal panels. The portion of the building closest to the Wardenclyffe Laboratory is two-stories. The condition of the additions ranges from partial collapse to good.

2. Wardenclyffe Tower Foundations – 1 Contributing Site; built 1903, demolished 1917

Perhaps the most iconic symbol of Wardenclyffe was Tesla's transmission tower. Even though only an octagonal ring of concrete and stone foundation remains visible, the image of the tower is still used on signage, logos, and publications a century after its demolition. It was the imposing tower that was at the heart of Tesla's dream for Wardenclyffe. This was where messages were intended to be sent across the Atlantic by harnessing the electrical currents of the earth.

The octagonal tower was designed by William D. Crow of the architectural firm McKim, Mead & White to meet Nikola Tesla's specifications. The tower, which had a wide, octagonal base, was almost entirely made of wood. The walls of the tower angled inward, were characterized by angled bracing, and were capped by a semicircular dome. Conductive materials, except in the electrode cupola in the dome, were kept to a minimum. The final height of the tower came to 187,' instead of the intended 210,' and the tower was located over a 120' deep well. There were two tunnels or trenches that ran from the powerhouse-laboratory to the base of the well; the well, tunnels, and trenches may be extant. However, they cannot be investigated as they are part of a brownfield site due to industrial chemical dumping during the twentieth century; as a result, they have been counted as part of the tower site and not as individual resources. One contained compressed air and water mains and the other contained electrical mains. These mains connected to 16 sections of large iron pipe that extended from the bottom of the well to the electrode at the top of the tower. A spiral stairway descended to the bottom of the well. Unfortunately, after the structure was demolished, the deep well below the structure was used a dumping ground for chemical waste products. The top of the site inside the foundation walls is now capped and monitored as a brownfield site.

Non-Contributing Resources

3. Bauer House – 1 Non-contributing Building; built circa 1920s, altered 1955, c. 1978

The only non-industrial building on the site is the ca. 1920s Bauer house. The house is located southeast of Wardenclyffe Laboratory and is oriented facing south toward Route 25A. A circular driveway is clearly evident in front of the house in early aerial photographs before Route 25A was widened. The building was constructed on a parcel which had been subdivided from Tesla's original acreage and which is unrelated to his ownership of the property. It is named for Robert Bauer, who purchased the house in the late 1920s after emigrating to the United States from Germany in 1927. The building has been substantially altered and is not individually significant.

The Bauer house is a 1-1/2 story, six-bay by two-bay side-gabled wood framed cottage covered in shingle siding and resting on a concrete foundation. The central part of the building, which features a one-and-a-half story, front-gabled porch, is slightly taller than the flanking sections.

Wardenclyffe Laboratory

Name of Property

Suffolk, NY

County and State

While the windows have been boarded up, the house retains its fenestration and six-over-six double-hung windows. The building has a full height basement except under the east wing, which was originally a porch. The main basement had a separate exterior entrance near the northeast corner at the rear of the house and has built-in booths. According to local lore, the house served as a “speak-easy” during Prohibition. In 1955, the family added a dormer to the north side of the house to create additional bedroom space, closed in an outside porch on the east side to create two bedrooms, and made other alterations. Additional interior alterations were made by the Agfa Corporation after it purchased the property from the Bauer family in 1978 and subsequently utilized the building as an employee break room.

4. Volatile Material Storage Building – 1 Non-contributing Building, built circa 1940s

The Volatile Material Storage Building is a freestanding building constructed circa 1940s and located to the east of the Wardenclyffe Laboratory. It is a one-story building with a concrete slab-on-grade floor, concrete block exterior walls with a painted flat stucco finish at the exterior, and a wood-framed hipped roof with wood shingles. The building measures 16.1 feet east-west x 10.0 feet north-south and has a single interior space. There is a flush hollow-metal door on the north façade and a small through-wall ventilation grill on the east and west facades.

“FLAMMABLE STORAGE” is painted on the exterior face of the east wall. There are no interior finishes. The underside of the wood roof is exposed at the interior.

5. Maintenance Shed – 1 Non-contributing Building, built circa 1940s

The Maintenance Shed is a freestanding building constructed circa 1940s and located to the east of the Wardenclyffe Laboratory and north of the Volatile Material Storage Building. It is a one-story wood-framed structure with a concrete slab-on-grade floor, vertical beaded board wood cladding at the exterior, and a wood-framed hipped roof with asphalt shingles. The building measures 26.2 feet east-west by 10.7 feet north-south. There are a pair of large swinging doors on the west façade for removal of equipment and two five-panel wood doors, one on either end of the south façade. Both door openings on the south facade have been covered with plywood. The western door is severely damaged and the eastern door has been removed and is stored inside. The interior of the shed has exposed wood framed walls. The wall studs are original but rafters have been replaced.

6. Boiler House – 1 Non-contributing Building, built between 1966-1970

The Boiler House is a freestanding building constructed between 1966 and 1970 and located in an interior courtyard nearly surrounded by the Wardenclyffe Laboratory and subsequent additions. It is a one-story structure with a concrete slab-on-grade floor, concrete block exterior walls, and a flat built-up roof over metal decking and steel bar joists. The building measures 34.0 feet east-west x 24.1 feet north-south and has a single interior space. There are two industrial

Wardenclyffe Laboratory

Name of Property

Suffolk, NY

County and State

steel sash windows on the north and south elevations and a large sliding door on the west elevation.

7. Air Handling Building – 1 Non-contributing Building, built between 1966-1970

The Air Handling Building is a long narrow freestanding building constructed between 1966 and 1970 and located in an interior courtyard nearly surrounded by the Wardenclyffe Laboratory and subsequent additions. It is a pre-fabricated metal building measuring 54.0 feet north-south by 10.1 feet east-west and served as mechanical space. The floor, walls, and ceiling/roof are all constructed of insulated metal panels. Large ducts are routed from this building across the roofs of adjacent buildings. The structure rests on steel beams which run north-south and rest on the ground.

8. Administration Building – 1 Non-contributing Building, built between 1976 and 1980

The Administration Building is a freestanding building constructed between 1976 and 1980 and is located on the southern edge of the property facing an asphalt-paved parking lot to its north. The building is located west of the Bauer House. The one-story building measures 154.2 feet east-west by 67.2 feet north-south. It has a concrete slab-on-grade floor, split-faced concrete block exterior walls, interior steel columns, and a built-up flat roof over metal decking and steel bar joists. The exterior of the building is composed of red and grey split faced block. Individual vertical fixed windows are separated by projecting grey pilasters which are flush with a horizontal projecting “cornice” of grey split faced block above. Between the groups of windows the exterior walls are red split faced block. There is a projecting entry canopy on the north façade supported by two grey split faced block columns. The interior has a center bathroom core and a glazed entry vestibule on the north elevation. Interior office partitions and finishes have been removed.

9. Industrial Wastewater Treatment Facility – 1 Non-contributing Building, built 1979, enlarged between 1980 and 1985

The Industrial Wastewater Treatment Facility is comprised of three sections. The southern section was constructed in 1979 and measures 59.2 feet east-west x 64.0 feet north-south. The floor is a concrete slab-on-grade with integrally poured concrete side walls which rise approximately three feet. Above this height a steel frame supports a metal deck roof. The exterior walls are vertical metal panels except where it abuts the center section of the building which is concrete block. The southern section is a single large volume with large tanks and elevated steel grate walkways.

The center and northern sections of the building, which were constructed between 1980 and 1985, measure 50.3 feet east-west x 101.2 feet north-south. The center section of the building has a lower roof than the northern and southern section and serves as a service vehicle garage and

Wardenclyffe Laboratory

Name of Property

Suffolk, NY

County and State

maintenance shop. The center section has a concrete slab-on-grade floor, concrete block walls, and a flat built-up roof on metal decking supported by steel bar joists. There is an access door and an overhead vehicle door in the west façade. At the interior, there is an elevated steel grate mezzanine that provides access to the southern section of the building. The northern section of the building is constructed similar to the southern section except that the exterior metal panels go to the floor slab. There is also an overhead door in the west façade for movement of equipment. The large volume contains a number of large fiberglass tanks and similar to the southern section, has elevated steel grate walkways.

10. Guard Shack – 1 Non-contributing Building, ca. 1960, renovated 2013

The existing guard shack is a one-story, one-bay by one-bay (6.5 feet by 6.5 feet) frame building located on the north side of the access drive from Randall Road. The exterior of the building is sheathed with cedar shingles and the structure has a hipped roof with a deep overhang and rounded brackets. Rectangular plate glass windows are located in the east and south elevations. It sits on an elevated concrete slab-on-grade with concrete steps leading to an access door in the west elevation.

11. Tesla Statue – 1 Non-contributing Object, 2013

The Tesla Statue, which was donated by the government of the Republic of Serbia and created by sculptor Prof. Nikola Koka Jankovic, is located near the southern border of the property and surrounded by a square fence. The granite base of the statue is square and includes inscriptions. A life-size granite statue of Tesla, which starts mid-leg and depicts him holding two gears that interlock, rests on the base.

7. Statement of Significance

Applicable National Register Criteria

(Mark "x" in one or more boxes for the criteria qualifying the property for National Register listing.)

- A. Property is associated with events that have made a significant contribution to the broad patterns of our history.
- B. Property is associated with the lives of persons significant in our past.
- C. Property embodies the distinctive characteristics of a type, period, or method of construction or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components lack individual distinction.
- D. Property has yielded, or is likely to yield, information important in prehistory or history.

Criteria Considerations

(Mark "x" in all the boxes that apply.)

- A. Owned by a religious institution or used for religious purposes
- B. Removed from its original location
- C. A birthplace or grave
- D. A cemetery
- E. A reconstructed building, object, or structure
- F. A commemorative property
- G. Less than 50 years old or achieving significance within the past 50 years

Statement of Significance Summary Paragraph (Provide a summary paragraph that includes level of significance, applicable criteria, justification for the period of significance, and any applicable criteria considerations.)

Wardenclyffe Laboratory is nationally significant under National Register Criterion B in the areas of science and engineering for its association with inventor and visionary Nikola Tesla (1856-1943). Tesla, one of the most important scientists and inventors of the modern age, worked at this lab between 1902 and 1906, and it was the site of his most advanced experiments in wireless power transmission. Wardenclyffe, including the laboratory and the ruins of a tower, both of which were designed to Tesla's specifications by American architects McKim, Mead and White, was Tesla's last laboratory; they are the only remaining historic resources associated with the inventor and his work (see Appendix A). Born in Croatia, Tesla displayed promise in his early education and work in technology. After inventing new equipment and rising to the head of Budapest's telephone exchange, Tesla began working for the Edison Company in Paris. In 1884, Tesla moved to the United States to work for Edison directly. Within the next two decades, Tesla, working with Westinghouse and independently as an inventor, made a mark on the scientific community and in the public imagination. His experiments with electricity resulted in the invention of the Alternating Current (AC) that we use today. He was a pioneer in X-ray technology, remote control, and wireless communication. Wardenclyffe, Tesla's laboratory and office from 1902 to 1906, represents the apex of Tesla's career, during which he developed and promoted his idea for a "World Wireless System" which would transmit energy and telecommunications without wires. Unfortunately, his failure to perfect his ideas for wireless technology fast enough, as well as the success of Marconi's telegraph system, led his backers to abandon him and led to his emotional and financial ruin. In 1915, he lost the heavily mortgaged property in his attempts to cover his debts. While Tesla continued to come up with new ideas, he was never able to rehabilitate his reputation and finances to secure another laboratory. Despite later twentieth century additions and alterations to the building, the laboratory is identifiable and understandable to Tesla's period and remains a testament to the life, work and genius of Nikola Tesla and his impact on the international scientific community. The period of significance for the Wardenclyffe Laboratory extends from 1901, when construction began at the site, through 1915, when Tesla lost ownership of the property.

Narrative Statement of Significance (Provide at least **one** paragraph for each area of significance.)

Nikola Tesla's Early Life & Career

Born at midnight between July 9 and 10, 1856 in Smiljan, Croatia, Nikola Tesla came into the world, according to legend, during a lightning storm.² Tesla was the fourth of five children born

to Serbian Orthodox priest Milutin Tesla and his wife, Djuka Mandic.³ During that time in Smiljan, illiteracy was more common than not and most occupational opportunities were limited to agriculture, the army, or the church.⁴ However in primary school, Tesla was a gifted scholar. The family moved a few miles to Gospic, where his father took a religious teaching position at what we would today consider a junior high school. There, Nikola attended as a student and immediately started experimenting with electricity, studying batteries and induction coils. After seeing a picture of Niagara Falls, he announced he would one day harness it for energy.⁵

He continued his studies at a higher school in Karlstadt (Karlocav), Croatia, where an influential physics professor encouraged him to continue his studies in electrical engineering. After Nikola nearly died from cholera, his father let him pursue engineering instead of insisting he follow in his footsteps and join the priesthood. Tesla then enrolled in the Austria Polytechnic School in Graz, Austria, in 1875 at the age of 19. There he began to toy with the idea of an alternating current under a German professor named Poeschl, who thought Tesla had great promise. However, his scholarship ended and he had to leave school. Due to his father's recent death, Tesla had to immediately begin looking for work to support himself.⁶

In 1880, Alexander Graham Bell's newly invented telephone was becoming popular in Europe. Tesla was informed that a central telephone station was to be installed in Budapest, which would be spearheaded by friends of the Tesla family, the Puskas Brothers. Starting at an entry level position, he quickly worked his way up in position by inventing improvements to the station's equipment, including a telephone amplifier. Notably, at the age of 25 he was put in charge of the telephone exchange.⁷ In 1881, the station was sold and the Puskas brothers recommended that Tesla find a position at the Continental Edison Company in Paris, a French company that made dynamos and motors under Thomas Edison's patents. Tesla worked there from 1881 to 1883, troubleshooting problems with power plants in France and Germany. There he met Charles Batchelor, a close associate of famous inventor Thomas Alva Edison, who helped Tesla obtain a position working for Edison. At age 28, with only a few coins in his pocket, Tesla arrived in New York City in June of 1884.⁸

Tesla began working for Edison in 1884 and quickly won Edison's confidence when he successfully repaired a broken set of dynamos on Henry Villard's ocean liner, the *Oregon*. Tesla frequently worked 16-hour days for Edison, repairing machines and generators, as well as

working on patents for arc lamps, regulators and dynamos.⁹ Tesla was confident that he could greatly improve Edison's Direct Current dynamos. Edison, doubtful but intrigued, allowed him to work on the project. It took him almost a year, but Tesla achieved his goal. Elated, Tesla asked Edison for the \$50,000 he had promised him if he succeeded., Edison refused, however, claiming that they had had no such agreement and that Tesla didn't understand American humor.¹⁰ Angered, Tesla resigned.

In March of 1885, Tesla met with patent attorneys who helped him apply for his first patent (no. 335,786), an improved design of the arc lamp which created light that did not flicker.¹¹ These patents brought him the attention of two investors, B.A. Vail and Robert Lane, who formed a lighting and manufacturing company in Tesla's name, the Tesla Electric Light & Manufacturing Company. However, once Tesla had completed his patent work on arc lighting, which belonged to the company, Vail and Lane disassociated themselves with the company to start their own company focusing on the distribution of arc lights. Tesla, who didn't own the patent and was paid in stock to a company that no longer existed, became bankrupt.¹²

The years 1886 and 1887 were very difficult years for Tesla, who was forced to find work as a day laborer in lower Manhattan, mostly digging ditches for the installation of cables connecting the headquarters of the Western Union Telegraph Company with the stock and commodity exchanges.¹³ In spring of 1887 he met Alfred S. Brown, who worked for Western Union Telegraph and also held several arc lamp patents and was very interested in Tesla's ideas of alternating current (AC). Joined by Charles F. Peck, a lawyer from New Jersey, the three men started a new company called the Tesla Electric Company. With financing from John C. Moore, who was connected to J.P. Morgan, they started a laboratory at 89 Liberty Street in Manhattan. Here Tesla was free to work as he wished on his AC machinery. Within six months Tesla had developed the AC induction motor and was immediately awarded 40 patents for the invention.¹⁴ Together they began manufacturing the first AC induction motors. Impressed by the news, *Electrical World* editor T.C. Martin stopped by the lab and convinced Tesla to write an article, his first publication, on the invention.¹⁵

With news of these patents circulating Wall Street, Tesla was gaining recognition and attention. The businessman, inventor, and electricity enthusiast George Westinghouse became aware of Tesla and met with him to offer him a consulting job at the Westinghouse headquarters in

Pittsburgh, PA. Tesla accepted and spent several months there. During that time, he developed the sixty cycle (or 60 hertz) induction motor, which is still the standard for alternating current in the United States today.¹⁶ On May 16, 1888, Tesla gave his first lecture to the American Institute of Electrical Engineers. Between 1891 and 1892, he gave four more popular lectures in America and Europe. By the end of 1892, Tesla had begun to gain celebrity status as a famous scientist.

The 1893 World's Columbian Exposition in Chicago helped to boost the fortunes of both Westinghouse and Tesla, who had been selected to light the buildings and grounds. In addition, Tesla also had his own exhibition at the World Fair under the Westinghouse banner. Electricity was one of the main attractions of the fair, and millions flocked to Electricity Hall. One of Tesla's displays produced the effect of lightning discharge accompanied with the familiar sound of thunder. It was one of the most novel attractions at the fair and was good at attracting visitors, as the noise could be heard throughout Electricity Hall.¹⁷ Tesla returned to New York from Chicago exhausted but also famous. Engineering magazines called him "the New Edison."¹⁸

Following the exhibition, Tesla focused on his new interests in radio and wireless technology in his New York City laboratory. At this time, Tesla began living at the Waldorf Astoria, where he was accepted into the social set of New York's elite and Wall Street heavyweights who would lounge and socialize there after work. This was an important group for Tesla, who was always on the search for wealthy investors. Disaster struck on March 13, 1895, when his laboratory caught fire and was destroyed. This set the inventor back on his work with radio, wireless technology, and x-rays.¹⁹

Tesla acquired a new laboratory space at 46 East Houston Street in New York in 1896; here he developed the technology of x-rays and his famous Tesla Coil. Tesla wrote to his patent lawyer that his coils were producing 4,000,000 volts with sparks jumping from wall to wall and that his laboratory in crowded Manhattan wasn't safe for him or the public. The inventor needed a secluded space to continue his experiments in wireless electricity. His patent attorney, Leonard E. Curtis, had associations with the Colorado Springs Electric Company and sent Tesla there to find a safe secluded place to continue his work. With the donations of wealthy friends and patrons, including Col. John Jacob Astor, Tesla designed and built a modest laboratory on the prairie east of Colorado Springs.²⁰

Planning Wardenclyffe

After spending eight months at his laboratory in Colorado Springs, the 43-year-old celebrity inventor returned to New York City in 1900. While in Colorado, Nikola Tesla produced point-to-point electrical discharge by creating sparks over 100 feet in length.²¹ Armed with photos of manufactured lightning, a new wireless telegraphy invention, and several new patents, Tesla began searching for new investors to take his findings in Colorado to the next level, which he would later call a “World Wireless System.”²² Tesla moved back into the Waldorf Astoria and continued his work at his laboratory at 46 E. Houston Street in downtown Manhattan. However, to advance on his recent experiments and create the World System, he needed to build a transmission tower.

The World System concept resulted from the culmination of several of Tesla’s discoveries. He proposed that telecommunications and electric energy could be transmitted throughout the world wirelessly. He claimed this would provide point-to-point telecommunication as well as the transmission of electric energy without wires on a global scale.²³ This would be possible with the construction of many Wardenclyffe-type towers around the world located outside major cities that would transmit and receive information and energy through the ground and from the atmosphere.²⁴ While describing what his new laboratory would do and the impact that the “World System” would have on our lives and the planet, the visionary described a future that seemed to resemble the internet:

As soon as completed, it will be possible for a business man in New York to dictate instructions, and have them instantly appear in type at his office in London or elsewhere,” Tesla said at the time. “He will be able to call up, from his desk, and talk to any telephone subscriber on the globe, without any change whatever in the existing equipment. An inexpensive instrument, not bigger than a watch, will enable its bearer to hear anywhere, on sea or land, music or song, the speech of a political leader, the address of an eminent man of science, or the sermon of an eloquent clergyman, delivered in some other place, however distant. In the same manner any picture, character, drawing or print can be transferred from one to another place. Millions of such instruments can be operated from but one plant of this kind.²⁵

Tesla’s article in *Century* magazine of June 1900, “The Problem of Increasing Human Energy,” suggested that the philosophical problems of mankind could be solved by harnessing power from

the sun, wind, and water.²⁶ This article included amazing photos from Colorado of electricity seemingly dancing around him.²⁷ The article brought Tesla the controversy and attention he needed for the ambitious project of building the first tower of the World Wireless System outside of New York City. Its publication, which gained the attention of New York's elite, including J. Pierpont Morgan, proved to be a first step in funding his new laboratory.

J. Pierpont Morgan, among the largest financiers of the time, was excited by the vision of the future Tesla described in his *Century* article. Morgan wasn't new to the innovations of electricity; he had arranged the merger of Edison General Electric and Thomson-Houston Electric Company to form General Electric. When the two met, Tesla described a plan for all wavelength channels to be broadcast from a single station. If Tesla were to succeed, Morgan would have a monopoly on radio broadcasting.²⁸ Morgan gave Tesla \$150,000, or over \$4.1 million today, to build a transatlantic telegraphic transmission plant.²⁹ Morgan, always a businessman, asked Tesla to sign over 51 percent interest in his radio patents as security for the loan.³⁰

With Morgan's investment in hand, Tesla began seeking a location for his new lab. Tesla envisioned not just a quiet isolated place for him to work on his experiments but also a power-and-broadcasting station which would employ thousands of people, a "Radio City," which would be the center of wireless broadcasting to the world through his World System.³¹ As before, Tesla relied on his social connections as he began exploring his options. Charles R. Flint, a real estate mogul and high-profile associate of Tesla, introduced Tesla to James S. Warden of the North Shore Industrial Company in Suffolk County. Warden, an Ohio banker and prospective developer, had purchased over 2,000 acres of land in Brookhaven on Long Island's north shore, roughly 65 miles from Brooklyn, to build a resort community which he eponymously named Wardenclyffe-On-Sound.

The town of Brookhaven was originally settled by New Englander colonists, mostly from Connecticut, in the 1650s. The portion that would eventually become Wardenclyffe (and Shoreham) was made up of two rural areas, Woodville and "The Ridge," nestled between the two villages of Miller's Place (now Miller Place) and Wading River. In the 1882 *History of Suffolk County, New York*, the area earned only two sentences, describing the lands eastward of Miller's Place as "a thinly settled farming district which extends to the east line of the town at

²⁶ Nikola Tesla, "The Problem of Increasing Human Energy," *Century*, June 1900.

²⁷ The photo was a fake, a double-exposure trick, where one photo was of the electricity sparks in an empty room and the other of Tesla sitting in a chair with the device off. The photographer combined the two photos into one.

Wading River. This section comprehends the localities of Rocky Point and Woodville, extending about seven miles.”³² Woodville was named after Richard Woodhull who negotiated a deed for the area from Native Americans. By the late 1880s, it consisted of a few small cabins on the beach but mostly orchards and farmland along both sides of Woodville Road, which today is the village of Shoreham. The southern portion that would make up Wardenclyffe was called “The Ridge” (now the hamlet of Ridge), which was farmland owned mostly by the Randall family for over 150 years.³³

In 1893, the proposed extension of the Long Island Railroad past Port Jefferson to Wading River led James Warden to speculatively purchase 2,635 acres, most from Charles Randall, of the above-mentioned farmland of Woodville and Ridge. The acreage stretched southernly from the intersection of the Long Island Railroad line and Ridge Road, zigzagging southeast around the farms of Charles P. Randall and John G. Randall all the way down to Middle Country Road, then returned in a straight line back north to the proposed Long Island Railroad.³⁴ In 1895, the Long Island Railroad did extend service past Port Jefferson to Wading River. It did not include a station at Wardenclyffe until 1900.³⁵ Once the plans to add the station were confirmed, the Oak Ridge company began construction on a development along the shore. By 1902, both Shoreham and Wardenclyffe appear as names for the community on the map.³⁶

Warden was interested in the potential future of an industrial center where 2,000-2,500 Tesla employees would build their homes. Tesla acquired 200 acres of remote land from Warden with the stipulation that he would purchase another 400 acres in the near future.³⁷ The 200 acres were located in the northwest corner of the North Shore Development Co’s land close to the train station. The property started at the intersection of Randall Road and North Country Road, running east along the Southern End of the Long Island Railroad for 2250’, then south 4000’ in a straight line to a corner of the land of then farmer George E. Hageman, then west in a line parallel to the northerly line back to Randall Road, following Randall Road north back to the starting point.

Building Wardenclyffe

Tesla wanted to achieve his dream of “World Wireless System,” a worldwide network of wireless communication and wireless electricity. To do this he needed to build a massive

telecommunication tower, visually similar to a radio tower, with a small powerplant to power it and double as his laboratory for experimentation. At the start of 1901, Tesla found himself perfectly suited to do it with financing from Morgan, 200 acres from Warden adjacent to a railroad station, and a friend in Stanford White.

Stanford White, of the celebrated architecture firm McKim, Mead, & White, was also excited by Tesla's *Century* article. As they were leading figures in their respective fields, the two men crossed paths frequently. In 1891, the two first met through Edward Dean Adams at Madison Square Garden. Adams was courting both men, White for architectural design and Tesla for electrical equipment planning, to work on the Adams powerplant at Niagara Falls. The two men met again at the Columbia Exposition in Chicago and frequently at the residence of mutual friend Robert Underwood Johnson, editor of *Century*. White eventually nominated Tesla for membership at the Players Club in New York.³⁸

Tesla approached Stanford White to design and prepare the drawings for his new laboratory and powerhouse. The dual-function building would provide space for Tesla's experiments and power the transmission tower. Letters between Tesla and White shed light into the development of the project. By April 26, 1901, White had quoted the powerhouse portion of the project to be built for \$14,000 (roughly \$390k today).³⁹ Later that spring, cost estimates came in from Mertz's Sons Construction at \$15,700 and Sturgis & Hill Co. at \$13,400. On June 1, 1901, White notified Tesla of the estimates before leaving for Canada. White worked on the Wardenclyffe project for free due to his friendship with Tesla, who was only billed for the draftsman's time.⁴⁰ He told Tesla that any further questions should be brought to Mr. Crow, an associate.⁴¹ Sturgis & Hill were selected as the builders for the brick 95' x 95' laboratory and powerhouse, the primary building at the site.

William D. Crow of East Orange, New Jersey, an architect working for McKim, Mead, & White, later became a well-known designer of hospitals and institutional buildings.⁴² White left the design of the tower to Mr. Crow. The tower was required to be made entirely of wood with limited use of bolts and had to be able to support a giant copper electrode 100 feet in diameter with a tubular diameter of twenty feet at its peak.⁴³ According to W.D. Crow's notes on the project, the architect had no knowledge of the electrical side of the project, but he was told to

⁴⁰ McKim, Mead, & White, Ledgers, 1900 – 1902, Library of Congress.

⁴¹ Stanford White to Nikola Tesla, June 1, 1901, Microfilm letter, Library of Congress.

⁴² In 1907, Crow and Luther Lewis left McKim, Mead, & White to start a new architecture firm with Hermon F. Wick called Crow, Lewis & Wick Architects. Crow, Lewis, & Wick designed many large hospital complexes in the New York and New Jersey area, including the Home for the Incurables (now St. Barnabas Hospital) in the Bronx, NY.

County and State

keep conductive materials to a minimum. In addition, W.D. Crow's notes also reflect that he was the primary designer for Wardenclyffe's laboratory and powerhouse.⁴⁴ Construction supplies and equipment were brought in by rail and construction of the laboratory moved at a quick pace. Laboratory machinery from Westinghouse also arrived by train. Construction on the one-and-a-half story brick laboratory and powerhouse started in the summer of 1901 and was completed in February of 1902.⁴⁵

While the construction of the laboratory was underway, Tesla's focus turned to the design of the massive tower. Though we don't know what the inventor's original calculations were for the intended height of the tower, we do know that it was planned to be much higher than what was finally constructed. Without White's approval, Tesla met with the American Bridge Company regarding the construction of the cupola of the tower as he believed that they it was best equipped to build the copper electrode cupola.⁴⁶ Soon after, Tesla received a quote from White to build the tower which shocked him and forced him to reevaluate his plans:

My dear Stanford: -

I have not been half as dumfounded by the news of the shooting of the President as I have by the estimates submitted to you, which, together with your kind letter of yesterday, I received last night. One thing is certain: we cannot build that tower as outlined.⁴⁷

To stay within budget, Tesla was forced to recalculate and shorten the overall height of the tower. He concluded that a tower closer to 200' with a roof composed of a single 20-meter diameter platform with spherical bodies of large curvature on the rim would work just fine.⁴⁸ While construction was underway, Tesla often stayed at a cottage opposite the Wardenclyffe Inn, overlooking the beach and Long Island Sound.⁴⁹

The story of Wardenclyffe is ultimately a tragic one. While its construction was underway, Tesla received his first blow to the project. On Dec 12, 1901, competing inventor Guglielmo Marconi sent the first wireless transmission across the Atlantic from Cornwall, England to Newfoundland, Canada. Marconi achieved this without anything similar to the tower and powerhouse that Tesla was building, surprising many, including Tesla's investors. Tesla was discouraged and accused Marconi of violating several of his radio patents, but he continued building his tower, which, in early 1902, had begun to gradually rise from the tree line of the North Shore of Long Island.⁵⁰

Wardenclyffe Laboratory

Name of Property

Suffolk, NY

County and State

A February 7, 1902 *Brooklyn Eagle* article reports on the progress of the venture.

The power house is completed and the foundations of the big tower have been laid, though the cold weather somewhat retarded the masonry work. The working room, or tower, which will be the foundation for Mr. Tesla's across-the-world flashes, will be octagonal in shape and will be 210 feet high, 100 feet in diameter at the base, narrowing down to 80 feet in diameter at the top. It will be constructed chiefly of wood, through the builders say that fifty tons of iron and steel and 60,000 bolts of various sizes are used in its construction.⁵¹

The final height of the tower came to 187' instead of 210.' A 120' well was dug beneath its base; the depth was necessary to reach groundwater. There were two tunnels or trenches that ran from the powerhouse-laboratory to the base of the well. One contained compressed air and water mains and the other contained electrical mains. These mains connected to 16 sections of large iron pipe that extended from the bottom of the well to the electrode at the top of the tower. A spiral stairway descended the well to the bottom.⁵²

At Wardenclyffe

On June 4, 1902, Tesla placed an advertisement in *Electricity Magazine* that all further correspondence to him should be sent to his Wardenclyffe office, signaling the completion of the lab and tower.⁵³ Security on the grounds was tight; only Tesla's approximately half-dozen assistants and workers were permitted. Tesla worked in quiet isolation. The public and newspapers speculated as to what exactly Tesla was up to, especially as the curious tower could be seen from miles away. The inventor was vague and unwilling to go into specifics. In the spring of 1903, Tesla finally gave a statement to the New York papers. In addition to specifying what the tower was for and what he was doing at Wardenclyffe, he predicted the modern mobile phone:

The wireless telegraphy plants you may have seen are but networks of flimsy wire. We are not doing anything of that sort here at Wardenclyffe. We are building for the future. It will be some time before our preparations are complete, but when we are ready we will be able to accomplish what we desire. We shall not be handling a plaything. It will be something for business. I do not believe that messages can be transmitted without wires for more than 50 or 60 miles without the use of the principles which I have patented throughout the civilized countries of the world. By the use of my system you will be able to put an instrument in your house and talk to anyone who has a similar apparatus anywhere in the country without any metallic or artificial connection.⁵⁴

The primary intent for the Wardenclyffe laboratory and tower was to demonstrate the radio-broadcasting phase of Tesla's plan for a "World System," for which he was issued several patents. These included patent No. 685,012, means for increasing the intensity of electrical

oscillations by use of liquefied air; 655,838, method of insulating electrical conductors; 787,412, art of transmitting electrical energy through the natural medium; 723,188, method of signaling; 725,605, system of signaling; 685,957, apparatus for utilization of radiant energy; and 1,119,732, apparatus for transmitting electrical energy.⁵⁵ Although the inventor and his workers performed many experiments at Wardenclyffe, it is clear that the majority of their work regarded wireless communications, wireless electricity, and his World System.

Tesla worked tirelessly on his experiments and inventions, sometimes working for days without sleep. In addition to his “World System,” he and his crew worked on other experiments. He launched a wireless radio-controlled model torpedo in the sound and also experimented with the power of high pressured water streams.⁵⁶ However, by spring of 1903, Tesla was running out of funds and started to face serious financial problems. He returned to New York to look for further investment, first from J.P. Morgan. Morgan was focused on investments with railroad centralization and other industrial ventures and did not respond to Tesla’s letters requesting additional funding. On July 3, 1903, a desperate Tesla sent another letter to Morgan, this time telling the financier that his tower was not just for sending radio signals but also to transmit power wirelessly.⁵⁷ Eleven days later Morgan finally responded “Dear Sir: I have received your letter...and in reply would say that I should not feel disposed at present to make any further advances.”⁵⁸

The following day, back at Wardenclyffe, Tesla responded to J.P. Morgan’s letter in his own way, by displaying the power of his operational tower, although it was unfinished and ostensibly still under construction. The skeleton framework of the tower and electrode cupola had been completed but the copper sheeting was never applied to the outside.⁵⁹ Area newspapers reported on the strange electrical displays locals were witnessing at night:

...from the tall tower and poles in the grounds where Nicola Tesla is conducting his experiments in wireless telegraphy and telephony. All sorts of lightning were flashed from the tall tower and poles last night. For a time the air filled with blinding streaks of electricity which seemed to shoot off into the darkness on some mysterious errand. The display continued until after midnight.⁶⁰

This continued for several nights. Tesla, rejected by Morgan, was likely looking for media attention as he began embarking on another fundraising campaign. Reporters flocked to the lab the following morning but the workers declined to say a word. Tesla himself was mysterious

about the nightly display of lightning. However, possibly to tease those captivated by the stories coming from Wardenclyffe, he gave a quote to the *New York Sun*: "... The people about there, had they been awake instead of asleep, at other times would have seen even stranger things. Someday, but not at this time, I shall make an announcement of something that I never once dreamed of."⁶¹

With the spectacle circling the New York papers, Tesla, deeply in debt and unable to afford additional coal for the tower, returned to New York City to pursue additional investors. However, the rapidly spreading rumors that Morgan had backed out of the project led others to shy away. Adding to his financial problems, Colorado Springs Electric Company sued Tesla for nonpayment of electricity furnished to the experimental station at Colorado Springs and the City of Colorado Springs sued him for nonpayment of water bills. On top of this, the caretaker of the station also sued the inventor for unpaid wages due to him. Desperate, Tesla managed to get by temporarily. He scrapped and sold the Colorado Springs station, which gave him the ability to pay his legal debts and other outstanding bills. In January of 1904, on the suggestion of his longtime assistant, accountant, and confidant, George Scherff, Tesla announced to the world he was available for consulting work.⁶²

Among the most pressing of Tesla's debts were his overdue payments for living at the luxurious Waldorf Astoria Hotel in midtown Manhattan. While Wardenclyffe was operational, the inventor continued to live at the Waldorf Astoria and commuted to Wardenclyffe by train. To keep his room and the hotel lawyers at bay, on April 27, 1904, Tesla mortgaged \$7,270 of the Wardenclyffe property to George C. Boldt, the owner of the hotel.⁶³

On May 9, 1905 Tesla lost yet another lawsuit, this time to the plaintiff, Dr. James Warden, who sued the inventor for not honoring his agreement to purchase an additional 410 acres at \$25 an acre.⁶⁴ Later that summer, negotiations for further funding from industrialist Henry Clay Frick had broken down. Adding further insult, Westinghouse was also avoiding Tesla's letters and pleas for help. Although Tesla reminded Westinghouse that the wireless energy he was developing would benefit Westinghouse the most, the latter declined to help the struggling inventor.⁶⁵

The year 1906, when Tesla turned fifty, was a troubling year for the inventor. His friend Stanford White was shot and killed on June 26, and in the fall his longtime assistant and accountant

George Scherff found full time employment elsewhere. Alone and broke, Tesla stayed in his hotel room at the Waldorf Astoria and his workers abandoned Wardenclyffe.

On May 5, 1908, Tesla mortgaged an additional \$5,379.82 to the Waldorf Astoria for his outstanding debts. As the plant laid vacant, trespassers began to notice that they could enter the property and climb the tower to overlook the Long Island Sound. At this time, Tesla opened an office at 165 Broadway (now 1 Liberty Plaza) to be closer to Manhattan's wealthy elite. There he was able to secure financing from Thomas Fortune Ryan, the well-known financier, and H. O. Havemeyer, the leading sugar refiner, who aided him with contributions of \$10,000 and \$5,000 respectively.⁶⁶ However, he used these funds to pay off his numerous other debts instead of those related to Wardenclyffe.

However, Tesla continued to work and believed that he would soon return to his laboratory on Long Island. In 1910, he moved his offices to the Metropolitan Tower, which had recently opened and was the tallest building in the world, where he worked on perfecting turbines. Without a laboratory, he tested a new steam model version at the Waterside Station of the New York Edison Company. After clashing with the engineers and staff, he abandoned the project in 1911. Without any cash to fund the project himself, he looked for other companies to finance his work with turbines.⁶⁷

Worsening the inventor's situation, Tesla lost another judgment in 1912, this time for \$23,500, to Westinghouse, Church, Kerr & Co. for machinery supplied to Tesla's Wardenclyffe laboratory. The machinery and equipment were taken from the site and returned to Westinghouse, Church, Kerr & Co to satisfy the judgment. In 1914 Tesla moved offices once more, this time to the Woolworth Building. Again, the office was in the tallest building at the time, surpassing the Metropolitan Tower. However, after several months of not paying rent, he was forced to leave. This same year, his longtime partner and early supporter, George Westinghouse, passed away.

Combined with interest, Tesla mortgaged nearly \$20,000, almost half a million dollars today, on his Wardenclyffe property. On March 30, 1915, unable to make any payments, was forced to sign over the entire property to Lester S. Holmes, a lawyer for the Waldorf-Astoria.⁶⁸ Fearing this would become public, which would damage his already bruised credibility and compromise further projects, Tesla arranged for the deed to be signed over to the Waldorf-Astoria through a silent intermediary.

After Wardenclyffe

Although Wardenclyffe now belonged entirely to the Waldorf Astoria Hotel, Tesla believed that the hotel company would be good stewards of the property and maintain it until he could get back on his feet and return to to finalize his World System experiments. Nothing was further from the truth. Instead, the hotel corporation tried to find a way to convert the site into cash. The March 1916 publication of *Export American Industries* ran a story titled "Tesla's Million Dollar Folly" complete with photos of the interior of the lab, showing files and machinery that was left behind. The article described the abandoned Wardenclyffe site: "There everything seemed left as for a day — chairs, desks, and papers in businesslike array. The great wheels seemed only awaiting Monday life. But the magic word has not been spoken, and the spell still rests on the great plant."⁶⁹ The story came out the same time as a *New York World* article reporting on Tesla's appearance in Suffolk County Supreme Court for his inability to pay back taxes of \$935 on Wardenclyffe. He revealed to the court that he had no real assets and lived mostly on credit.⁷⁰

On May 18, 1917, Tesla was presented with the Edison Medal, the highest honor awarded by the Institute of Electrical and Electronics Engineers. Two months after this celebration, the inventor was notified that the laboratory had been vandalized and plans for the tower to come down were underway.⁷¹ In July 1917, dynamite was laid at the base of the giant tower to begin demolition. The blasts alarmed the locals of Shoreham and the newspapers falsely reported that the US government spearheaded the demolition, suspecting German spies were using the tower for espionage.⁷² Instead, it was the Smiley Steel Company of New York, which was hired by Waldorf Astoria Hotel Corporation to take down the tower and sell its parts to cover outstanding debts. As more dynamite was needed than expected to bring down the mighty tower, the corporation only gained \$1,750 above salvage costs.⁷³

After the tower came down, the Boldts and the Waldorf Astoria left the laboratory and property vacant while Tesla spent a brief time in Chicago working on bladeless turbines for the Pyle National Company. When he returned to New York in late 1918, he moved into the St. Regis Hotel. From there, Tesla established a pattern of moving from hotel to hotel, leaving behind unpaid bills. His last office was at 80 West 40th Street in Manhattan.⁷⁴ In the years to follow, George C. Boldt Jr. and the Waldorf Astoria sold off parcels of the Wardenclyffe Property. In 1925, they sold the last remaining portion, which included the laboratory and tower site, to Walter L. Johnson, a lawyer in Brooklyn.

Tesla continued to develop new ideas and often met with the press to announce new plans and concepts he was working on. His last patents were issued in 1928, when he was nearing 72 years-of-age. These patents were for an aerial transportation device, a vertical take-off and landing vehicle, resembling a helicopter.⁷⁵ On January 7, 1943, the inventor and engineer died at his room at the New Yorker at 86 years of age. Tesla never gave up on the idea of wireless electricity and broadcasting, but Wardenclyffe was his last laboratory and the last hope for the visionary's plans of a wireless World System.

Later History of the Wardenclyffe Site

In 1938, the Long Island Railroad line east of Port Jefferson stopped operating. This same year Plantacres, Inc. purchased 16 acres, including the laboratory, from Walter L. Johnson and leased it to the Posi-Print Corporation, which later reorganized as Peerless Photo Products and eventually purchased the site. Peerless used the site as a manufacturing plant of emulsions for photo paper.

In the summer of 1939, Peerless renovated Tesla's laboratory for use as a factory and offices for the new company. The open design and brick construction of the Wardenclyffe laboratory allowed for its sub-division with minimal disruption to the original building. A twenty-foot addition added onto the northwest corner to allow for new coating equipment to be installed; additional freestanding buildings were constructed at this time, including a concrete block boiler house, storage building to store flammable materials, and a wood framed storage building, which appears to have been used for grounds maintenance equipment.

As the company grew, the manufacturing processes changed, and production increased, the main plant "building" was continually expanded and additional buildings and additions were constructed to the north and west of the original laboratory building. In 1942, an addition was constructed on the north side of the laboratory to house a finished store room, cutting room, and packing room. In January 1950, the 1939 addition was elongated to allow for an extension to the "coating alley." In 1951, Building Number 4 was constructed northeast of the original laboratory as a freestanding building housing equipment storage, plant maintenance, raw paper storage, and truck loading platforms. In 1952, a 120-ft tall, 20-ft diameter, 40,000-gallon water tank (no longer extant) was constructed west of the buildings to supplement water pressure from the municipal water system for use in fire protection of the buildings. Building Number 5, constructed in 1957 as warehouse space, connected the 1942 addition to Building Number 4 constructed in 1951. Three additional structures were constructed on the property between 1962

⁷⁵ Nikola Tesla, Apparatus for aerial transportation, Patent 1,655,114 filed October 4, 1927, and issued January 3, 1928; Nikola Tesla, Method of aerial transportation, Patent 1,655,113 filed September 9, 1921, and issued January 3, 1928.

and 1966. In 1969 Peerless was taken over by Belgian firm Agfa-Gavaert, then a subsidiary of Bayer, which continued to use the site for the same purposes and continued to expand the main plant. Another two additions were added by 1978 and three more by 1984.⁷⁶ Two additional freestanding buildings, an industrial waste-water treatment facility and an administration building, were constructed between 1978 and 1984 at the southwest corner of the site away from the main production facility.⁷⁷

Agfa ceased manufacturing operations at the site in 1987.⁷⁸ Prior to the construction of the industrial waste-water treatment plant, significant ground contamination occurred on the site Peerless Photo Products disposed of untreated process water into 800 feet long by 25 foot wide recharge basins. The water contained metals such as cadmium, silver, lead, and other compounds. The former stairwell which descended 120 feet below Tesla's tower may have been used as a disposal site for the wastewater as late as 1973.⁷⁹ Agfa began a cleanup of the site in 1993 under the auspices of the New York State Department of Environmental Conservation. While cleanup was underway, Tesla fans, scientists, and locals, began planning to acquire and preserve what remained of Wardenclyffe. In 1996, the Tesla Science Center, originally called Friends of Science East, was formed.

In 2012, boarded up with plywood and once again vacant, the historic site was almost sold to developers. However, a successful crowdfunding campaign, in collaboration with the popular comic website (and Tesla fan) Matthew Inman's *The Oatmeal*, helped the Tesla Science Center raise more than a million dollars to finally save the laboratory building and site. On May 2, 2013 the Tesla Science Center purchased the property and on July 10, 2014, Tesla's 158th birthday, the organization announced that billionaire entrepreneur Elon Musk, who named his electric car company after the inventor, had pledged \$1 million to the creation of a museum at Wardenclyffe.⁸⁰ It is the intent of the Tesla Science Center to restore Wardenclyffe Laboratory to its appearance during the period of Nikola Tesla's ownership and to interpret the building as a museum dedicated to his work. It plans to remove non-contributing buildings in close proximity to Wardenclyffe Laboratory and renovate other structures on-site to provide support facilities or space for programs that support the museum's mission.

Verbal Boundary Description (Describe the boundaries of the property.)

The boundary is indicated by a heavy line on the enclosed map with scale.

Boundary Justification (Explain why the boundaries were selected.)

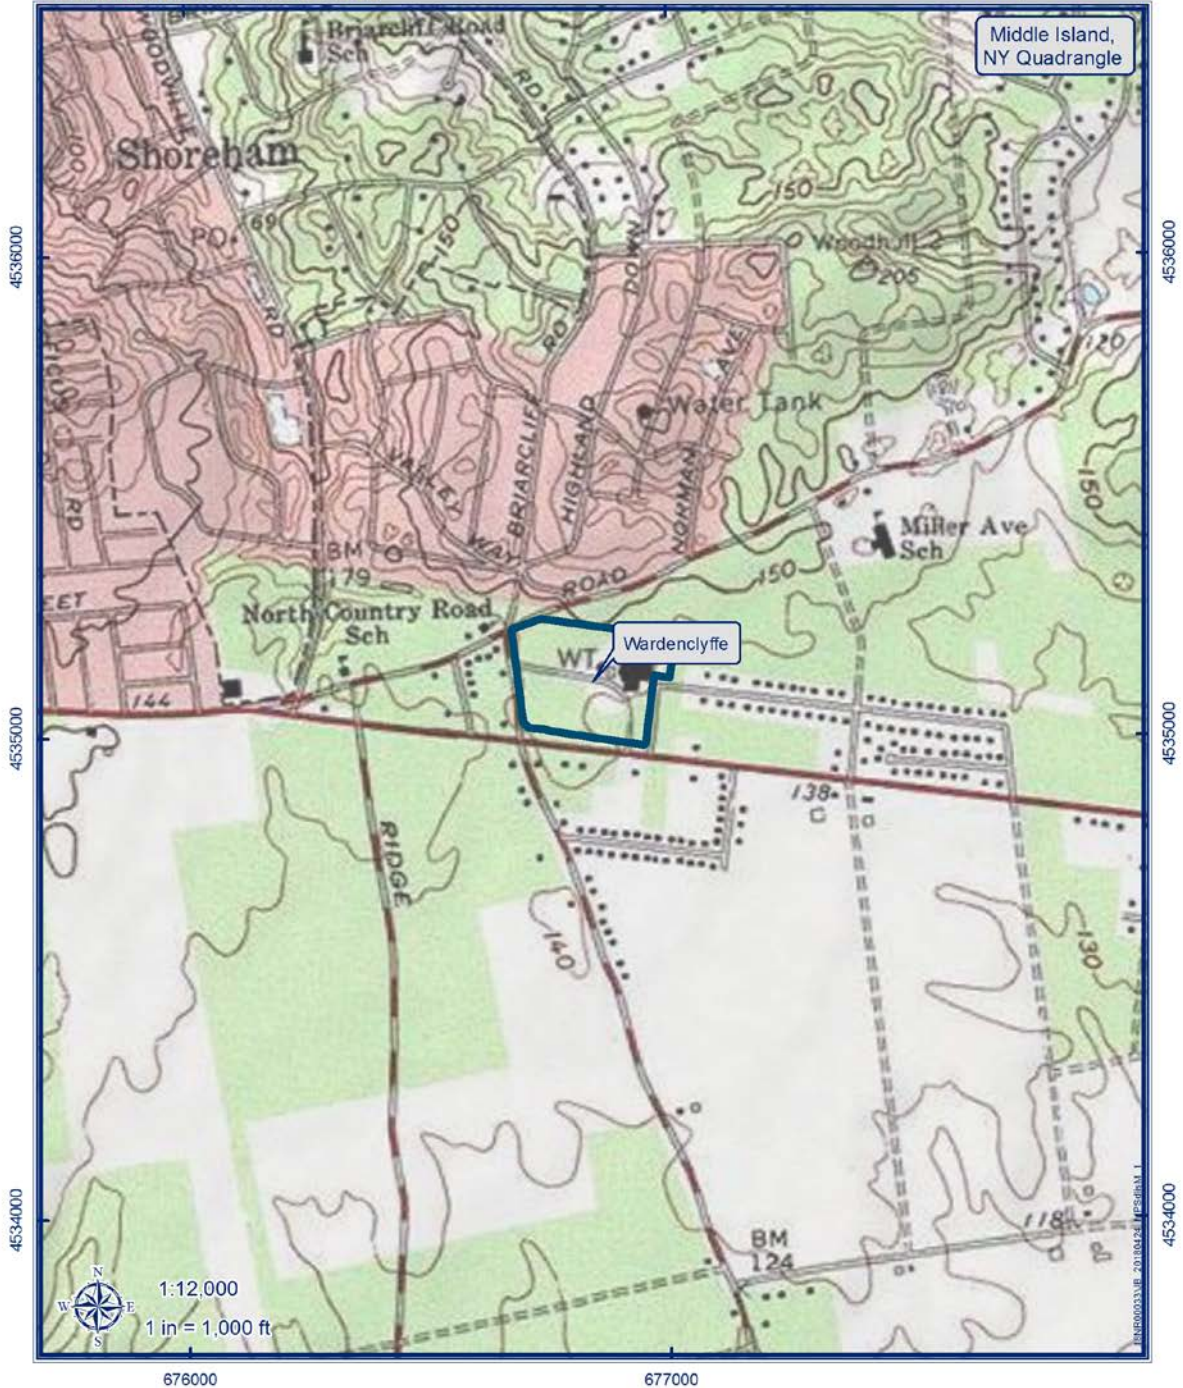

This nomination boundary was drawn to include the largest, most important, and most intact portion of the original 200-acre parcel owned by Nikola Tesla. This 16.43-acre site includes his original laboratory and the site of his former tower at Wardenclyffe. It also includes some non-historic buildings constructed by later owners Peerless Photo Products and its successor Agfa Corporation; however, the site remains largely open space typical of its historic appearance. Outside of this boundary, the acreage associated with Tesla's ownership was developed into residences and businesses during the 20th century and no longer retains integrity to its appearance during Tesla's ownership.

***Re: Nikola Tesla's Wardencllyffe - National Register of
Historic Places Endorsement***

Dear Ms. Betsworth;

I write to express my strong support for the inclusion of the Nikola Tesla Wardencllyffe site in the National Register of Historic Places.

Wardencllyffe is of great historic importance, not only to residents of New York State, but to citizens of the United States and, indeed, of the world. Nikola Tesla was a visionary scientist whose contributions have greatly benefitted humankind. His system of producing alternating current electricity is the foundation of our modern electric grid. Tesla was a prodigious inventor, holding almost 300 patents for inventions such as the induction motor, vertical takeoff vehicle, radio, remote control, x-ray technology, robotics, and more.

Wardencllyffe is the last laboratory in existence where Tesla worked. In addition, the beautiful brick laboratory building was designed by Tesla's friend, world-renowned architect Stanford White, further adding to its historic and cultural value.

Wardencllyffe is now being renovated into a science center for education, research, and entrepreneurship that will continue Nikola Tesla's work to advance science for the betterment of humanity. I strongly endorse the nomination of Wardencllyffe for designation in the National Register of Historic Places and appreciate your kind consideration of these comments.

Sincerely,

**CONSULATE GENERAL OF THE REPUBLIC OF SERBIA
NEW YORK**

Jennifer Betsworth
Historic Preservation Specialist
NYS Division for Historic Preservation
Pebbles Island State Park
P.O. Box 189
Waterford, NY 12188-0189

New York, June 6, 2018

Dear Ms. Betsworth,

I was very pleased to learn that Nikola Tesla's Wardenclyffe Laboratory site is being considered for inclusion in the National Register of Historic Places. I support this nomination both personally and professionally and I am hoping that it would receive the strong approval of the NYS Division for Historic Preservation.

The Serbian people take great pride in being able to call the great Nikola Tesla the one of our own. However, the truth is that most of his life he lived here, in the New York State. It is here that his greatest inventions that forever changed the history of mankind had come about. And it is here, in New York City, that he passed away. So, one can rightfully argue that he was, above all, the U.S. scientist and inventor. Yet, once in the U.S., Tesla admirers who seek to trace his footsteps and to pay homage to the great scientist find it very hard to discover physical traces of his life and work in the U.S. Indeed, all there is to see is the room in the New Yorker Hotel where Tesla spent the final years of his life and Tesla's Corner at the New York City's Bryant Park. I am sure that you would agree with me that a man who indebted the world with the invention of electricity and so much more deserves to be remembered and celebrated in more appropriate way.

And then, there is the Tesla's last remaining laboratory at Wardenclyffe, Long Island, the site that has been saved from certain ruin only thanks to the great effort, love and dedication of the members of the Long Island community gathered around the Tesla Science Center at Wardenclyffe. These great admirers of Nikola Tesla managed not only to preserve this site of remarkable historic significance, not just for the United States or Serbia, but for the world as a whole. No, they did much more, they have develop it into a

science center for education and research, thus honoring Nikola Tesla and providing everlasting inspiration for the future young scientist who would carry on Tesla's legacy.

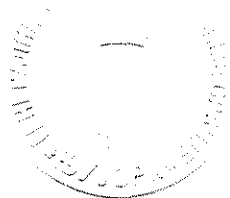

The people of the Tesla Science Center at Wardenclyffe already did their part in order to ensure Wardenclyffe's preservation and future as a place of national and international importance, and now NYS Division for Historic Preservation has opportunity to help by including Nikola Tesla's Wardenclyffe Laboratory site in the National Register of Historic Places, for the benefit of the New York State, the United States and the world as a whole.

Just take a look around your office and imagine a world without the genius of Nikola Tesla and you will see how much indebted by him we all are. This is our chance to give back.

Respectfully,

Mirjana Zivkovic
Consul General of the Republic of Serbia

Jennifer Betsworth, Historic Preservation Specialist
NYS Division for Historic Preservation
Peebles Island State Park
P.O. Box 189
Waterford, NY 12188-0189

Dear Ms. Betsworth,

I write to express my support for listing the Nikola Tesla's Wardenclyffe laboratory in the National Register of Historic Places. As the proud representative of the district in which Wardenclyffe stands, I wish to express my strong support for this nomination as it is reviewed by the NYS Division for Historic Preservation.

As the last laboratory in which visionary scientist Nikola Tesla worked, I believe Wardenclyffe deserves to be listed in the National Register of Historic Places as a New York State landmark. Nikola Tesla was a prodigious inventor, holding almost 300 patents for inventions, including the radio, induction motor, vertical takeoff vehicle and remote control. Tesla's system of producing alternating current electricity provides the foundation of our modern electric grid. Furthering the historic and cultural significance of Wardenclyffe, the brick laboratory building was designed by world-renowned architect Stanford White, a personal friend of Tesla's.

Wardenclyffe is now being renovated into a science center for education, research and entrepreneurship that will protect Nikola Tesla's legacy of innovation and experimentation and share his work with a broad audience. I urge full and fair consideration of Wardenclyffe's nomination for listing in the National Register of Historic Places.

Sincerely,

Re: Nikola Tesla's Wardenclyffe - National Register of Historic Places Support of Nomination

Dear Ms. Betsworth:

I understand that Nikola Tesla's Wardenclyffe site is being considered for inclusion in the National Register of Historic Places, and, as director of Nikola Tesla Museum in Belgrade, wish to express my strong support for this nomination as it makes its way before the NYS Division for Historic Preservation.

As the last existing laboratory of one of the world's greatest scientists and humanitarians, Wardenclyffe is a site of remarkable historic significance. Nikola Tesla's discoveries include such monumental advancements as alternating current (A/C) electricity, the induction motor, x-ray technology, fluorescent lighting, radio, and wireless technology. This last invention was the focus of Nikola Tesla's work at Wardenclyffe from 1901 to 1906, and culminated in the construction of a 187-foot wireless transmitting tower which was erected in front of Wardenclyffe laboratory.

Both the brick laboratory and tower were built by Tesla's friend, world renowned architect Stanford White, further adding to the site's historic value. Although the tower was dismantled in 1917 due to financial hardship, the large octagonal tower base remains, as does the original brick lab building.

Wardenclyffe is being preserved and developed into a science center for education and research that will honor Nikola Tesla and continue his legacy of advancing science for the betterment of humankind. Inclusion in the National Register of Historic Places will help ensure Wardenclyffe's preservation and future as a place of national and international importance. Thank you for considering this property as a National Historic Landmark.

Sincerely,

Branimir Jovanovic
Director
Nikola Tesla Museum

PRESERVATION
LONG ISLAND

May 23, 2018

NYS Office of Parks, Recreation, and Historic Preservation
Attn: Jennifer Betsworth

Re: Wardencllyffe Laboratory Historic District
Nomination to the National Register of Historic Places

Dear Ms. Betsworth and Members of the New York State Board for Historic Preservation:

As the regional advocate for historic preservation on Long Island, Preservation Long Island is pleased to submit this letter in support of Wardencllyffe Laboratory's nomination to the National and State Registers of Historic Places.

Wardencllyffe Laboratory is best known for its remarkable connection to the visionary scientist and inventor, Nikola Tesla (1856–1943), who conducted experiments at the site from 1901 to 1915. Originally designed by renowned American architect Stanford White, who was also a friend and admirer of the inventor, Wardencllyffe is the only existing laboratory site in the United States where Tesla conducted his studies.

Listing on the National and State Registers will open more funding opportunities to restore Wardencllyffe and enable visitors to access the site safely. Moreover, the listing will encourage continued study and preservation of Wardencllyffe as one of Long Island's most significant 20th-century historic resources; its distinctive lab design by Stanford White to accommodate Tesla's unique scientific needs undoubtedly merits further investigation, as does Wardencllyffe's wider role in American history.

Thank you for considering Preservation Long Island's comments in your review of the Wardencllyffe Laboratory Historic District nomination; we believe this site deserves to be recognized and celebrated for its extraordinary ties to Nikola Tesla and his immense contributions to science and technology.

With sincere regards,

Sarah Kautz,
Preservation Director

Dear Ms. Betsworth:

As the founding Board of this organization, we are all strongly in support of having Wardenclyffe listed on the NY State and National Registers of Historic Places.

Wardenclyffe's historic significance is well known in the community of Shoreham and the larger Town of Brookhaven, and the site holds a proud place on the Town's list of historic places. Wardenclyffe is also important in the history of science and is recognized as such by the American Physical Society, which added it to its list of significant science locations.

The laboratory was designed by famed architect Stanford White, and the foundation of Tesla's transmitting tower was designed by White's associate, W.D. Crowe. Both structures still exist as testament to Tesla's visionary ideas for the transmission of communications and electrical power.

Although Wardenclyffe is not yet open to the public on a regular basis, the site receives over a thousand visitors from around the world every year. It is considered an important site to Tesla fans, historians, and science enthusiasts.

These visitors and supporters of Wardenclyffe recognize Nikola Tesla's immense contributions to modern life: alternating current electricity, wireless technology, the induction motor, fluorescent lighting, and many more. For many, Wardenclyffe stands as proof of the impact made by the life and work of one man. We appreciate the opportunity to secure Wardenclyffe's future in history through this nomination to the National Historic Register. Thank you, from all of us, for your consideration.

Sincerely,

Jane Alcorn
President

Re: Nikola Tesla's Wardenclyffe - National Register of Historic Places Support of Nomination

Dear Ms. Betsworth,

I would like to take this opportunity to wholeheartedly endorse the nomination of Nikola Tesla's Wardenclyffe for inclusion in the National Register of Historic Places!

The National Register of Historic Places is the official list of the Nation's historic places worthy of preservation. Nikola Tesla's Wardenclyffe is a testament to the genius of one of the most important scientists and inventors of the modern age and is of national and international significance.

Without Nikola Tesla, our world would be a very different place. It was Nikola Tesla that discovered how to practically transmit electrical currents over long distances through the use of Alternating Current; he pioneered the development of remote-controlled devices; he invented X-ray technology; he invented fluorescent lighting; and he was a pioneer in radio technology.

Wardenclyffe is the only remaining laboratory of this incredible man and was constructed at the height of his career. Wardenclyffe Tower was designed by Tesla to harness electricity from the earth itself and to send messages across the planet. If not for loss of financial backing during the project, the world may have benefitted further from his genius.

There are numerous examples of historic buildings across the country which have witnessed important events in our Nation's history, but few that are affiliated with someone that has transformed society as we know it like Nikola Tesla.

Sincerely,

Mark Thaler, AIA
Partner

Greetings!

I understand that Nikola Tesla's Wardencllyffe site is being considered for inclusion in the National Register of Historic Places, and wish to express my strong support for this nomination as it makes its way before the NYS Division for Historic Preservation.

As the last existing laboratory of one of the world's greatest scientists and humanitarians, Wardencllyffe is a site of remarkable historic significance. Nikola Tesla's discoveries include such monumental advancements as alternating current (A/C) electricity, the induction motor, x-ray technology, fluorescent lighting, radio, and wireless technology. This last invention was the focus of Nikola Tesla's work at Wardencllyffe from 1901 to 1906, and culminated in the construction of a 187-foot wireless transmitting tower which was erected in front of Wardencllyffe laboratory.

Both the brick laboratory and tower were built by Tesla's friend, world renowned architect Stanford White, further adding to the site's historic value. Although the tower was dismantled in 1917 due to financial hardship, the large octagonal tower base remains, as does the original brick lab building.

Wardencllyffe is being preserved and developed into a science center for education and research that will honor Nikola Tesla and continue his legacy of advancing science for the betterment of humankind. Inclusion in the National Register of Historic Places will help ensure Wardencllyffe's preservation and future as a place of national and international importance. Thank you for considering this property as a National Historic Landmark.

As a financial backer of the site's restoration and noting the support of the Science Center itself: I support this nomination.

Thank you for your time and attention!

Ms. Betsworth,

Your consideration of Wardenclyffe as an addition to the National Historic Register is not only overdue, but laudable. The Tesla Science Center is a long overdue addition celebrating a titan of turn of the century science.

Development of Wardenclyffe is active, ongoing, and and important. My hope is that with proper recognition, this site can be fully restored, and enjoyed for years to come.

Thank you,

ROSE HARVEY
Commissioner

15 June 2018

Alexis Abernathy
National Park Service
National Register of Historic Places

Mail Stop 7228

1849 C Street NW
Washington DC 20240

Re: National Register Nominations

Dear Ms. Abernathy:

I am pleased to submit the following ten nominations, all on disc, to be considered for listing by the Keeper of the National Register:

Amagansett U.S. Life-Saving and Coast Guard Station, Suffolk County (U.S. Government Lifeboat Stations, Houses of Refuge, and pre-1950 U.S. Coast Guard Lifeboat Stations)

St. Stephen's Roman Catholic Church Complex, Erie County [note: no longer owned or used as a religious institution]

Fuller Shirt Company Factory, Ulster County
Immanuel Union Church, Richmond County
Buffalo Public School #57 (PS57), Erie County
Buffalo Public School #44 (PS 44), Erie County
Pine Hollow Cemetery, Nassau County
Wollensack Optical Company, Monroe Company
Faith Missionary Baptist Church, Erie County

Wardenclyffe Laboratory, Suffolk [note, while Wardenclyffe is technically a district, there is only one owner, who supports the nomination; please see the file of supporting documentation, which contains more than 9,500 expressions of support for this nomination]

Please feel free to call me at 518.268.2165 if you have any questions.

Sincerely:

Kathleen LaFrank
National Register Coordinator
New York State Historic Preservation Office
