### DESCRIPTION: WALNUT CANYON NATIONAL MONUMENT

The archeological district for Walnut Canyon National Monument is composed of 232 prehistoric sites, occupied primarily by the Northern Sinagua between A.D. 500 and A.D. 1250 (Baldwin and Bremer 1986). Known since the 1880s for its cliff dwellings, the monument includes other sites, such as pithouse villages, multi-room pueblos and single room fieldhouses, artifact scatters, rock art and agricultural sites. These are managed and interpreted for the public by the National Park Service.

The cultural affiliation and dates for the sites were determined using decorated ceramic types and architectural styles. The Kayenta Anasazi occupied 2 sites during the main occupation period of the canyon. No other periods are represented in the monument, although a brief occupation during the Archaic Period, around 3700 B.P., is indicated by the split-twig figurines which were found in a cave in Walnut Canyon east of the boundary (Olsen 1966).

### BOUNDARY JUSTIFICATION

The boundaries of the 2249-acre archeological district coincide with the fenced National Park Service boundaries [Maps 1-2]. The entire monument was placed on the National Register in 1966 by administrative decision following the enactment of the National Historic Preservation Act. The emphasis of the nomination was on the cliff dwellings; however, a 1985 archeological inventory of 71% of the monument, (including survey of both rims and 64% of the inner canyon) provides data which allow a balanced assessment of the significance of all site types. Variation in the distribution and variety of sites between the north and south rims and the canyon slopes provides good settlement pattern data. The monument only varies 550 feet in elevation, but includes 4 distinct vegetation zones. Areas without sites likely provided food and raw material resources important to the prehistoric inhabitants; these areas also are critical to understanding the settlement pattern.

### ENVIRONMENT

Walnut Canyon National Monument is approximately 7 miles east of Flagstaff in northern Arizona. The monument is bisected by about 6 miles of Walnut Canyon, which eventually drains into the San Francisco Wash. Prior to dam construction upstream in 1904, the perennial Walnut Creek cut a canyon, 200 to 400 feet deep and 1/4-mile wide, by meandering from west to east through limestones and sandstones of the Kaibab and Toroweap formations and the Coconino Sandstone. The downcutting of the creek through a series of north-south trending faults and fractures (Benfer 1971:11) produced distinctive peninsulas and "islands." The upper limestones weathered into inhabitable ledges sheltered by overhangs. Elevation ranges from 6,280 feet to 6,830 feet. The vegetation represents two life zones, the Upper Sonoran and the Transition zones. Principal tree species include ponderosa pine, pinyon pine, juniper, oak and Douglas fir. On the exposed, dryer areas, grass, shrubs and various species of cacti and yucca also are found. Seepage and runoff along the canyon floor support riparian vegetation dominated by box elder and Arizona walnut.

### HISTORY OF THE MONUMENT AND PREVIOUS RESEARCH

In 1883, James Stevenson of the Smithsonian Institution made the first record of the Walnut Canyon sites, comparing them with the ruins in Canyon de Chelly and recommending further investigation. Before 1895, the Institution mounted 4 more expeditions there. The local ranchers, townsfolk, and tourists numbering in the thousands by the turn of the

CONTINUATION SHEET	DESCRIPTION	ITEM NUMBER	PAGE
		7	1

century, undertook their own explorations and unearthed many artifacts as well, sometimes resorting to extreme excavation techniques such as dynamiting (Stein 1986:50-57).

Protection for the ruins began in 1904, when the federally administered San Francisco Mountain Forest Reserve, a part of the present-day Coconino National Forest, stationed a ranger to assist visitors and monitor canyon use. On November 30, 1915, a national monument of 960 acres was established by President Woodrow Wilson. In 1938, it was expanded by President Franklin D. Roosevelt to its present size, with a Santa Fe Railroad inholding of 238 acres.

Archeological work completed at Walnut Canyon National Monument includes 7 excavation projects, 8 stabilization projects and 10 archeological surveys (Table 1). Most of the projects were conducted by National Park Service or Museum of Northern Arizona staffs. Major projects are described in more detail below.

**Archeological Survey.** Most of the data on the prehistory of Walnut Canyon resulted from archeological surveys. Beginning in 1920, Harold Colton (1932) recorded 70 sites in the canyon and on the rims, as well. While an inadequate survey by today's standards, the results later helped him formulate the first descriptions of the Sinagua culture and of a local ceramic typology.

Van Valkenburgh (1958) conducted the first intensive survey of 4 sections on the north rim, but all sites may not have been located because of heavy ground and snow cover. She recorded 78 sites of which only three were dated prior to the eruption of Sunset Crater (A.D. 1066).

In conjunction with Northern Arizona University, Euler (1962) recorded 38 sites in a systematic survey of the south rim. The sites were less dense and less variable in architecture and artifact assemblages than those on the north rim, and were probably used seasonally during the growing season. Again, slim evidence was found for occupation of the area before about A.D. 1066.

Worth mentioning are two special purpose surveys. Cramer (1965) surveyed the drainages in the northwest corner of the monument to locate agricultural features. He recorded more than 40 checkdams suggesting that farming was an important activity for the prehistoric occupants of the canyon. For the NPS List of Classified Structures (LCS), Sudderth and others (1976) assessed the significance and level of maintenance necessary to preserve 54 standing wall structures in the monument (Table 2 denotes LCS sites in Column 2).

In 1985, the most comprehensive survey of the monument was undertaken by Baldwin and Bremer (1986). Excluding the entrance road easement (330 acres) and the Santa Fe inholding (238 acres) and 270 acres of the inner canyon east of the Visitor Center, the entire monument was surveyed intensively; 67 of the 241 sites were recorded for the first time (Baldwin and Bremer 1986:1-3). Of the total, this nomination covers the 232 sites that are prehistoric.

**Excavation and Stabilization.** Only 10 sites in the monument have been excavated. Prior to stabilization, Hargrave (1932) excavated 2 rooms (AZ I:14:168), tree-ring dated to A.D. 1100, on the south end of Third Fort Island. One site (NA4052?) was excavated by Beaubien (1940), the park custodian, prior to construction of the entrance road along the western north rim. The excavation and stabilization of 3 sites (AZ I:14:177-179) by Ezell (1940) marked the beginning of a formal park service stabilization program. Van Valkenburgh (1958) excavated AZ I:14:100 and AZ I:14:102, the former an enigmatic dirt

mound with artifacts; the latter was a 2 to 3-room structure dating between A.D. 1066 and 1150. To mitigate the impacts of ranger residence construction, Maule (1960) excavated two sites (NA5891 and an unnumbered site). To aid interpretation of sites on the north rim, Ritchie (1970) and Kelly (1968) excavated a community cluster of masonry rooms and pithouses (AZ I:14:96) dating from A.D. 1100 to 1250.

A total of 37 sites, all but one in the canyon, have been stabilized. In addition to stabilization efforts by Hargrave (1932) and Ezell (1940), Rixey (1948) stabilized 5 sites on the Island Trail. Richert (1955, 1958) stabilized 9 sites (3 on the south side of the canyon below "Fourth Fort," and 6 on the north canyon slope, west of the Visitor Center). Mayer and Waggoner (1968a, 1968b) stabilized the site excavated by Ritchie (1970) and Kelly (1968) on the north rim interpretive trail, as well as 6 sites on the Island Trail. Sudderth (1973) completed the most extensive stabilization project (21 sites on the north and south slopes of the canyon, 17 of which had never been stabilized).

**CULTURE HISTORY**

Baldwin and Bremer (1986:38-42) indicate that not all periods of the local prehistory are represented at Walnut Canyon. No evidence of Paleo-Indian or Archaic occupation is found, although a brief occupation by the Archaic hunters and gatherers, around 3700 B.P., is suggested by the discovery of split-twig figurines in a cave not far from the east boundary of the monument (Olsen 1966).

Colton (1932, 1946) described eight phases of the [Northern] Sinagua culture around the Flagstaff area, that began around A.D. 500 and ended just after A.D. 1300. Knowledge of the chronology is necessary in understanding the prehistory of Walnut Canyon. Baldwin and Bremer (1986:33-38) summarize the chronology well. Briefly, the Cinder Park Phase extends from around A.D. 500 to 700 and is characterized by low density population located mainly in the cinder fields around Turkey Tanks (northeast of Walnut Canyon) dispersed in small farming sites of from 1 to 3 pithouses. The phase is roughly contemporaneous with the Basketmaker III Period of the Pecos Classification. The Sunset Phase, from A.D. 700 to 900, shows few differences in architectural style, settlement pattern or site distribution, but does have distinctive ceramics which correlate with the Basketmaker III/Pueblo I transition of the Pecos Classification. The Rio de Flag Phase, from A.D. 900 to 1066, is characterized by an increase in the population and its dispersal into a larger area around Flagstaff. Architectural differentiation begins; pithouse construction persists in combination with the earliest masonry structures, in planned villages of up to 8 rooms; structures also include the first fieldhouses and storerooms. As originally defined (McGregor 1941:281-282), the following phase is composed of three foci (Angell, Winona and Padre), evidenced by variation in pithouse construction and artifact assemblages. Recent tree-ring dates (Breternitz 1966; Harlan 1962) indicate that all three foci are contemporaneous, and date from around A.D. 1066 to 1150. Thus, during the Angell-Winona-Padre Phase, the indigenous population expanded, probably as the result of a Pan-Southwestern population increase. While pithouses were the predominant house type, the use of coursed masonry becomes widespread. The structures are arranged in a formal village plan, often centering around a central community structure. The Elden Phase, from A.D. 1150 to A.D. 1250, marks the greatest population in the area, with the people living mainly in surface masonry structures of from 1 to 70 rooms. Site size clustered into three

CONTINUATION SHEET      **DESCRIPTION**      ITEM NUMBER      7      PAGE      3

classes: primary sites were largest and probably controlled access to goods and services; secondary sites were habitations for most of the people; and tertiary sites were fieldhouses and other limited activity sites used on a seasonal basis. Finally, the Turkey Hill Phase, from around A.D. 1225 or 1250 to 1300, is distinguished by population aggregation into large, widely dispersed masonry pueblos, such as Elden Pueblo and Turkey Hills Pueblo. By the end of the period, the Flagstaff area was abandoned.

Two sites at Walnut Canyon were occupied during the Cinder Park Phase. However, Baldwin and Bremer (1986:42, 158) suggest that Walnut Canyon had two main occupations. During the first, from A.D. 800 to 950 (Sunset and Rio de Flag phases) at least 5 agricultural and food-processing sites were occupied (Baldwin and Bremer 1986:39-40). These were located in the canyon and on the rims, but seem to cluster on the rim in the southeast corner of the monument.

Following a hiatus in occupation from around A.D. 950 to the time of the eruption of Sunset Crater (A.D. 1066), the second occupation began and continued through the Angell-Winona-Padre and Elden phases to around A.D. 1250. Of nine tree-ring dates from six cliff dwellings, only one (A.D. 935) is prior to A.D. 1070; the one cutting date is A.D. 1206 (Robinson, Harrill and Warren 1975:82). Only 2 sites (less than 1%) in the park were not inhabited at sometime during the last occupation. The settlement pattern is one of a hierarchy of small villages, hamlets, and farming or other limited activity sites. Sites seem to be located nearest to access routes into or out of the canyon and to pockets of arable land. The large clusters of rooms, particularly on the north rim, were probably year-round habitations. Forts and other defensible features located nearby, along canyon access routes, may have been instrumental in regulating the flow of people and goods. The shaded location of the more than 80 cliff dwellings with more than 300 rooms suggests that they probably were used only for summer seasonal habitation. One and 2-room masonry fieldhouses used only during the growing season occur everywhere, but predominate on the south rim. The environment there is slightly higher in elevation and more marginal, but the areas may have been planted to offset the generally unpredictable nature of dry farming in the Southwest (Baldwin and Bremer 1986:155). The presence of numerous intrusive ceramics and exotic goods, such as worked ornamental stone, indicates interaction with people over a wide area, although Walnut Canyon probably was more a recipient than a source in the larger trade and exchange network (Baldwin and Bremer 1986:157-158). These ties were demonstrated when the canyon inhabitants moved to the Anderson Mesa area shortly before A.D. 1250.

Only 2 artifacts of historical Indian origin were collected in the monument, one a Hopi Jeddito Black-on-yellow sherd (dated post-A.D. 1300) and one a fingernail-incised sherd, possibly of Apache origin (Stein 1986:70). Yet Gilman (1976) gives a theoretical discussion of the activities which the Native Americans may have pursued at Walnut Canyon, and Stein (1986:69-70) discusses documented cases, including the collection of medicinal plants and pinyon nuts for food by both Navajo and Hopi Indians.

**ARCHEOLOGICAL SITES IN THE WALNUT CANYON ARCHEOLOGICAL DISTRICT**

A list of prehistoric archeological sites, arranged by Arizona State Museum site number, is shown in Table 2. The list includes additional site numbers and references, site location by UTM and site type. Site data were generated from the intensive National

Park Service survey of Baldwin and Bremer (1986). Maps 1 and 2 are USGS 7.5' quads showing district boundaries and areas surveyed. Site locations are plotted on a drafted map (Map 3) of the same scale.

Nine types of sites were identified: agricultural sites, artifact scatters, cliff dwellings, fieldhouses, forts, lithic scatters, multi-room structures, rock art sites, and two-room sites. Baldwin and Bremer (1986) relocated an enigmatic rock mound feature (AZ I:14:100) tested by Van Valkenburgh (1958) that did not fit any of the above site types. An isolated community room below Third Fort (AZ I:14:202) also was recorded. A descriptive summary of the sites (Table 3) is arranged by site type. Illustrations taken from Baldwin and Bremer (1986) (Figures 1-8) and photos (Photos 1-19) are used to depict representative sites of each type.

**Agricultural Sites.** At Walnut Canyon, checkdams (rock alignments perpendicular to drainages) (Photo 1) and terraces or rock alignments (perpendicular to slopes or on flatter areas) occur singly or in series, and usually are associated with fieldhouses (described below; see Figure 8). The alignments were used in dry farming to control water flow and soil erosion, or resulted from the clearing of fields. More than 40 checkdams and terraces were associated with a cluster of sites on the north rim (Cramer 1965). There are at least 19 such sites in the monument (Baldwin and Bremer 1986). Only three sites had agricultural features in isolation (see Table 3).

**Artifact Scatters.** All but two of the nineteen sites recorded as artifact scatters have possible pithouses, including one dating to the early Cinder Park Phase (A.D. 500-700) and 2 from the Rio de Flag Phase (A.D. 900-1066). Surface indications of pithouses include curvilinear (Photo 2) and single- or double-coursed wall outlines with an interior space of about 40 m<sup>2</sup>, lack of wall fall, artifact concentrations, deep soils, and fire-cracked rock (Baldwin and Bremer 1986:106). Pithouses were the dominant house form in the Walnut area until after A.D. 1066. The form is variable within and between phases; most of the early pithouses have short lateral entries or alcoves, firepits, four-post roof supports and a peripheral post pattern. The earliest are shallow, circular or sub-rectangular houses in pits. Later they may be timber-lined and as deep as 2 m. Masonry-lined pithouses (cf. Wilcox 1986:75) appear after A.D. 900 and persist until the area is abandoned.

**Cliff Dwellings.** Although only 64% (Baldwin and Bremer 1986:1) of the canyon was surveyed, 87 cliff dwellings (37% of total sites) with more than 300 rooms were recorded. Constructed during the Elden Phase (A.D. 1150-1250), the presence of cliff structures makes the Walnut Canyon district unique. They cluster around the Second and Third forts, as well as on the west-facing slope of Ranger Canyon, and probably were used for habitation during the summer months; perhaps the warmer south and west facings and areas below north rim settlements were preferred locations (Baldwin and Bremer 1986:121, 155) (Photo 4). Although the sites range from 1 to 16 rooms each, the typical cliff dwelling consists of from 2 to 4 contiguous, mortared masonry rooms, 3 to 6 m across (Figure 1, Photos 5-8). The plastered walls extended from the floor to the ceiling of the ledge with small ventilator holes at the top and bottom. Exterior doorways are modified T-shaped, some with original wooden lintels (Sudderth and others 1976:18). Lintels that were added

CONTINUATION SHEET      DESCRIPTION      ITEM NUMBER      7      PAGE      5

during stabilization are noted in stabilization reports. The walls are in various states of preservation, depending on the original construction and on the history of pothunting, vandalism and stabilization for each site (Photos 9-10). The types and extent of stabilization are well documented in the reports. Materials were largely replaced in kind, and the architectural integrity of the structures probably was not greatly compromised. Many sites have hearths, extensive smoke blackening on the ceilings, open rooms perhaps used as storage or outside work areas, and coursed masonry retaining walls below the rooms.

**Fieldhouses.** Seventy-two sites (31% of total) were designated as fieldhouses. In general, these were single rectangular or square rooms with northeast entries, ranging in size from 1.2 m by 1.4 m to more than 4 m by 3 m (Figure 2, Photo 11). The original wall height probably was less than 1 m; the double-coursed wall construction may have supported a brush superstructure (Baldwin and Bremer 1986:104). Fieldhouses that have been excavated in the Flagstaff area lack firepits or other interior features. The few artifacts found show an emphasis on mealing and farming activities (Pilles 1978:125), and indicate short-term, seasonal occupations. Fieldhouses may have proliferated after A.D. 1000 as a response to exhausted farmlands and changes in environmental conditions, and allowed a rapidly growing population to experiment with farming in different habitats (Pilles 1978:131).

**Forts.** Although five forts dating to the 11th and 12th centuries (Elden Phase) have been recorded in Walnut Canyon, only 3 lie within the boundaries of the district. "Third Fort" is encircled by the "Island Trail." These are masonry structures with defensive walls or walled compounds of about 5 rooms that are located on "islands" or finger ridges separated from the main rim by narrow saddles (Photo 12; Figures 3-5). The position of massive walls (Photo 13) across points of easy access suggests a defensive function for the sites, but they may also have been located to regulate the distribution of goods and services throughout the canyon (Baldwin and Bremer 1986:110, 156). Similar sites dating to the same period have been located in the Chevelon (White 1972), Clear Creek (Wilson 1969:236-237), Jack Canyon, Canyon Diablo, and Canyon Padre (Colton 1932:52-53) drainages, and at the Grand Canyon (Euler and Chandler 1978:75).

**Lithic Scatters.** Five sites have no artifacts or features other than flaked stone. The tools are made mostly from obsidian, fine-grained basalt, jasper, chalcedony and quartzite, while the cores, utilized pieces and debitage are made of the local Kaibab chert. Most of the sites are located on the south rim (Photo 14), probably the result of denser occupation on the north rim (where large sherd and lithic scatters are found) than of specialized activity (Baldwin and Bremer 1986:101). These cannot be dated.

**Multi-room Structures.** Baldwin and Bremer (1986:121-122) define multi-room sites as those with more than 2 rooms that had full-height masonry walls and abundant trash, often concentrated in middens. These probably were used for year-round long-term occupation. Many also show functional differentiation of rooms; pit structures and smaller storerooms may be found clustered with masonry rooms (Figures 6-7). Twelve sites fit this description (Photo 15-16). The largest single masonry structure in the district is a 5-

PAGE

6

to 6-room pueblo (AZ I:15:77). The largest grouping of structures (AZ I:14:96), 5 1- to 3-room masonry structures, 1 excavated (Ritchie 1970) and 3 possible pithouses and a couple of roasting pits, is the major attraction on the north rim interpretative trail near the Visitor Center. Five sites could not be dated accurately; one dated to the late Angell-Winona-Padre Phase (A.D. 1100 to A.D. 1150) and the remainder to the Elden Phase (A.D. 1150 to A.D. 1250). These large sites are characteristic of the late occupation of the district, after A.D. 1100.

**Rock Art Sites.** Two sites in the district have petroglyphs and one has pictographs. Ten anthropomorphic pictographs in red, white and yellow pigment are isolated in an overhang in a tributary on the south side of Walnut Canyon, and cannot be dated. The petroglyphs are pecked into the Coconino Sandstone in canyon bottoms. One site has three panels with 2 geometric designs, and 3 pairs of anthropomorphs, one of which is a pair of Kokopelli flute players. The other site has 4 small panels on boulders and cliff walls with a combination of anthropomorphic, zoomorphic and geometric (mostly spirals) designs. Historical graffiti mars the latter two sites.

**Two-Room Sites.** Baldwin and Bremer (1986:102, 108) differentiated between 1-room fieldhouses and 2-room sites (cf. Pilles 1978). The possibility of pithouses at 16 of the 27 two-room sites indicates that these may have had longer term habitation as well as storage functions. Construction is similar for both site types, although more variable for 2-room sites. The rooms may be contiguous or not; only slightly more than half of the masonry structures face southeast, as opposed to southwest (Photo 18, Figure 8). All but 7 of the sites were in use during the Elden Phase; 14 have Angell-Winona components and 1 a Rio de Flag Phase occupation.

**Miscellaneous.** Two sites did not fit any of the above site types, a rock mound (AZ I:14:100) of unknown function which Van Valkenburgh (1958) excavated, and an isolated community room (AZ I:14:202). The latter is a massive, double-coursed masonry surface room, 7.6 m by 6.6 m, with a south entry and 10-m long wing wall (Photo 19). The site is located near Third Fort; most of the cliff dwellings and forts are visible. The site may have been a focus for local and regional interaction (Baldwin and Bremer 1986:156).

**COLLECTIONS**

Items recovered from excavation and survey include ceramics, flaked stone, ground stone, bone, textile and basketry fragments, shell, and clay and vegetal samples. Most of the artifacts are curated at the Western Archeological and Conservation Center in Tucson, the Museum of Northern Arizona (cf. Hargrave 1932; Van Valkenburgh 1958), and the Archeology Laboratory at Northern Arizona University (cf. Euler 1962; Kelly 1968; Ritchie 1970). Two "lots" of artifacts are at the Smithsonian Institution in the cultural laboratory of the Museum of Natural History. Collected in 1883 and 1901, the material has historic as well as archeological significance (Gilman 1975:27). Approximately 1700 archeological items, as well as geologic, floral, faunal and archival material, are stored at Walnut Canyon National Monument. Nine wood samples from 7 sites are stored at the Laboratory of Tree-ring Research in Tucson, Arizona (Robinson, Harrill and Warren

1975:82). Prehistoric items on display at the monument include pottery, ground and flaked stone, projectile points (a few with arrow shafts), textile fragments, and shell and bone artifacts.

**HISTORICAL RESOURCES AND NON-CONTRIBUTING PROPERTIES**

The Visitor Center (headquarters, AZ I:14:230), 2 residences (AZ I:14:228, 229), a public restroom (now at AZ I:14:230) and a split-rail fence were constructed by the Civilian Conservation Corps (CCC) between 1939 and 1941. Along with a utility building built in 1945 and now at AZ I:14:229, they may be eligible as a separate National Register historic district (Stein 1986:76-79), and as such are non-contributing properties to this nomination (Table 5).

In addition to the headquarters district, other evidence of historic use of the monument was recorded in 1985 (Stein 1986:70-75). Except for AZ I:15:100, all of these are non-contributing properties to this archeological district nomination. Sixteen inscriptions (only a small portion of canyon graffiti), 6 clusters of trash, a stone monument erected by the Daughters of the American Revolution (DAR)(now at AZ I:14:230), the Old Headquarters Cabin (AZ I:14:113; listed on the National Register, 1975), and the Ranger Trail and Ranger Trail Bridge (AZ I:14:176) are also within monument boundaries. All inscriptions located thus far were found at cliff dwellings, and are not significant as separate entities; these should be included as features of the prehistoric sites. The trash clusters, unassociated with historical structural remains, possess limited research potential; only one (AZ I:15:105) had no prehistoric component and is excluded from this nomination. The DAR monument lacks integrity and significance under Register criteria (Stein 1986:72, 74-75). The trail and bridge appear significant under Criterion A of the National Register, and could be added as an amendment to the Old Headquarters nomination (Stein 1986:76).

Two prehistoric sites (AZ I:14:93, AZ I:15:100) had historical components which may be eligible for the National Register (Stein 1986:74). AZ I:15:100 is a prehistoric site with two structures, one of which was reconstructed historically into a hunting blind; the structure shows historical resource utilization and adaptive use of the structure as well (Stein 1986:74). Because the two uses are inseparable from a research standpoint, both components of this site must be included in this nomination. However, AZ I:14:93 has a historical component, a quarry that is spatially discrete. Stein (1986:74) recommended that more research was needed to determine the dating and significance of the component. Therefore it is recommended that the quarry be considered for inclusion in a future nomination of historical sites at Walnut Canyon.

The historical properties (see Table 5) comprise a coherent body of resources (and data) that can inform about historical visitation at and utilization of Walnut Canyon, and about the early development and rustic architecture of a National Monument. They are the only non-contributing sites in the monument and should be nominated separately as a historic district.

**DISTRICT INTEGRITY AND DATA LIMITATIONS**

The only developed area in the district is on the north rim. The Visitor Center and other CCC-period buildings, described above, form a discrete historic district. Ranger-conducted tours began again in 1986 along the Old Ranger Cabin Trail. Unassisted hiking is not allowed except along the "Island" and "Rim" interpretative trails, which begin from the Visitor Center. Ruins along those trails are protected by virtue of their high visitation and their visibility. A picnic area on the rim is open to the public as well. Little additional development in Walnut Canyon National Monument is expected.

Of the 232 prehistoric sites in Walnut Canyon National Monument, all but 53 have been disturbed by pothunting, vandalism, logging, grazing, construction, natural erosion or archeological excavation and stabilization (Gilman 1976) (Table 4). The lack of surface artifacts from which to derive fine-tuned dating is immediately apparent upon visiting the cliff dwellings. That most of the cliff dwellings were pothunted seems likely. Few of the vandals kept records detailing the locations of their finds, but analysis of the Smithsonian artifacts or of collections from local families who have recorded locational data may be helpful. Virtually all the canyon sites were defaced by historical graffiti, and portions of walls were destroyed by cattle grazing and pothunting (Stein 1986:65). Of the more than 300 cliff dwellings counted by Paul Beaubien, he considered only 2 in good condition; on August 24, 1940, the wall between those two collapsed (Stein 1986). Yet little disturbance has occurred since the boundary fence was completed in 1978.

As described above, 10 sites have been excavated; 37 are stabilized. Stabilization reports serve as verbal and photo documentaries of architectural integrity prior to and following the work, rather than as adequate records of excavated deposits or recovered artifacts. Undisturbed deposits may exist in many of the rooms that were never systematically excavated, or beneath the talus slopes below. Architectural integrity probably was not severely compromised, and the reports will be valuable sources of information on the original condition of structures and on the presence of original lintels, which could be used for dating.

Sites on the rims have suffered little damage, except for 5 sites that have been disturbed by construction and one that was excavated and stabilized for interpretation. The new locational and site data collected by Baldwin and Bremer (1986) is more than adequate by today's professional standards. The dating of sites from small surface collections has failed to locate more than a few early sites (Cinder Park to the Rio de Flag phases); perhaps the small ceramic samples are unrepresentative. The nature of subsurface deposits in rim sites is equally uncertain because so few sites have been excavated. The variety in architecture style of pithouses and masonry structures, or of either exterior and interior features is unknown. Since preservation of the sites in their present condition is the current management policy, these data may be collected from sites outside district boundaries, or in the future, by the use of non-destructive techniques.

SPECIFIC DATES A.D. 500 - A.D. 1250 BUILDER/ARCHITECT Northern Sinagua

## STATEMENT OF SIGNIFICANCE

### SIGNIFICANCE: WALNUT CANYON NATIONAL MONUMENT

Walnut Canyon National Monument was listed on the National Register following the enactment of the National Historic Preservation Act on October 15, 1966. Of national significance, the monument was created by Presidential Proclamation (No. 1318) on November 30, 1915, to preserve the more than 300 cliff dwellings and other prehistoric sites built by the Northern Sinagua. Nearly all of the sites were occupied between A.D. 1100 and A.D. 1250, a time of population expansion throughout the Southwest; what is unique about this archeological district is the quantity and excellent preservation of the cliff structures, which are examples of prehistoric architecture. Those are associated with defensible "forts" located on islands spaced throughout the canyon, and with small villages, hamlets and farming sites located on the north and south rims. In part, the information gathered by Colton (1932) from these sites was used as the basis for the definition of the [Northern] Sinagua culture. Recent archeological survey (Baldwin and Bremer 1986) of 71 percent of the monument located 232 prehistoric sites; those data are current and of high professional quality. Stabilization of sites in the monument has helped maintain the architectural integrity of the standing walls. Excessive vandalism was restricted to the cliff dwellings; those activities are notoriously unsystematic, so undisturbed deposits may remain. Along with the numerous pristine sites on both rims, the sites in the district have the potential to yield further information about the prehistoric past (Criterion D).

## INTERPRETIVE VALUE

The monument is administered by the National Park Service (Western Region). At the Visitor Center, park staff, museum exhibits and printed material are available to help the nearly 100,000 annual visitors to understand and appreciate the lifeways of the inhabitants more than 800 years ago. The Island and Rim trails are open for self-guided tours; in addition, the Ranger Cabin Trail is open for ranger-conducted tours.

Wupatki National Monument and Elden Pueblo, a ruin administered by the U. S. Forest Service, also interpret Northern Sinagua prehistory. Wupatki, while occupied around the same time, has none of the cliff dwellings. Elden Pueblo portrays a later phase of occupation, and may have been one of the sites to which the Walnut Canyon people moved. The Southern Sinagua monuments, Tuzigoot, Montezuma Castle and Montezuma Well, interpret a later period of occupation also.

## DISTRICT DESIGNATION

Each of the 232 prehistoric sites is significant, with integrity and the potential to yield information. Taken as a district, their significance increases because a greater number of research issues can be addressed regarding the spatial, temporal and cultural relationships between sites. Individual research issues are discussed below.

INVENTORY -- NOMINATION FORM**

CONTINUATION SHEET      **SIGNIFICANCE**      ITEM NUMBER      7      PAGE 1

The seven non-contributing sites are properties dating to the historic period. The historical resources form a coherent body of data that represent early visitation and development of the national monument. Pending more detailed documentation of architectural details of the CCC period buildings and additional research of the quarry component at AZ I:14:93, those properties should be nominated as a historic district.

**RESEARCH ISSUES**

1. **Archaic Period.** No sites in the district can be dated to this period; however, the presence of split-twig figurines in a cave adjacent to the east boundary of the monument (Olsen 1966) indicates that at least limited use of the district occurred around 3700 B.P. Possibly the lithic scatters in the district are Archaic; further surface collections could locate diagnostic tools.

2. **Sinagua Culture History.** Only six known sites in the district date prior to the Elden Phase (around A.D. 1120 or 1150) (Baldwin and Bremer 1986). Earlier Sinagua sites in the region are found at slightly higher elevations around the perimeters of meadows (Pilles 1979; Wilcox 1986). While the Walnut Canyon sites may follow this pattern, analysis of more complete surface collections, and limited excavation at sites suspected of early components, could clarify this issue.

3. **Architecture.** Other than the accurate mapping of 54 of the cliff dwellings during the LCS (Sudderth and others 1976) and site plans from rim excavations (Kelly 1968; Ritchie 1970), no architectural studies have been undertaken for research purposes at the monument. Site data (Baldwin and Bremer 1986) include descriptions of smoke blackening from hearths which precedes some room construction and not others. Inspection of the joints of walls could also provide data regarding the construction sequence of structures. Analysis of the well preserved wall mortars, to pinpoint the sources of the raw materials, could indicate the area, and consequently the people, with which the cliff dwellers interacted (Pilles 1986:personal communication). (Stabilization reports are sufficiently detailed that locations of the original fabric can be distinguished from historical additions.) Site plans and construction techniques of other site types, such as pithouse villages and fieldhouses, could be compared to those from the Sinagua area at large.

4. **Dating.** Only 9 tree-ring dates from 6 sites have been recovered from Walnut Canyon (Robinson and others 1975). Although in some cases timbers were added by stabilization crews, the reports allow us to distinguish between those and original wood. A large sample of wood from the ruins would allow more accurate dating than is possible with ceramic or radiocarbon dating, and definition of the building sequence of the cliff dwellings. No radiocarbon or archeomagnetic dates are known; the potential for such dating is high due to the excellent preservation in the cliff dwellings and possibly, in the rim sites. Obsidian hydration curves for the Flagstaff area are improving; since much of the flaked stone in the district is obsidian, this could provide accurate dates, especially important on sites where diagnostic ceramics are not found. More accurate

dates than can be derived from ceramic cross-dating may allow definition of shorter occupations at individual sites. This would contribute to settlement pattern and environmental studies.

**5. Environmental Adaptation and Paleoclimate.** From survey data, Baldwin and Bremer (1986:155-156) identified two classes of land use, agricultural and habitation, which relate to environment. Studies of the soils throughout the park and of the topographic location and morphology of the numerous agricultural features could elucidate the type of farming used there. The amount of potential arable land may be used to estimate the potential population size. Extraction of pollen and other vegetal material in cultural deposits from various site types could suggest what the climate was like, and how it changed throughout the occupation. Whether sites are year round habitations or if not, in which seasons they were occupied also may be discerned. These data relate directly to studies of subsistence and settlement patterns.

**6. Subsistence.** Corn specimens and other perishables found in some of the cliff dwellings indicate excellent preservation. Existing or new collections of floral, faunal and pollen data and of perishable artifacts, such as cotton textiles, basketry and bone, can suggest the types and variety of natural and domesticated resources used by the prehistoric people, the size of the area which they utilized, and the relative importance of cultivated or wild plants. Subsistence may vary seasonally, with site type, or in a particular site type, may vary through time.

**7. Settlement Pattern.** Site data from Walnut Canyon are ideal for a synchronic study of settlement patterns. The functional variation in the 9 site types and their interrelationships may indicate social organization and land use patterns. Fieldhouses are dispersed throughout the rim areas around hamlets and small villages. This hierarchy may relate to the size and function of social groups. What is the nature of the functional differentiation between one and two-room sites? Are the small sites and cliff dwellings permanent or seasonally occupied, a factor which determines whether they contribute to population estimates? Other fort sites in the region are not associated with large numbers of habitation rooms or with community rooms such as the one at Third Fort (AZ I:14:204) (Pilles 1986:personal communication). The forts may represent central places (Hodder and Orton 1976:55-69) like Ridge Ruin which were important in community integration and in the regulation of goods and services (McGregor 1941). Comparisons of Walnut Canyon data from complete surface collections or subsurface contexts, with similar data from the Flagstaff area may elucidate these topics.

**8. Trade and External Relationships.** The presence of two sites with large Kayenta Anasazi assemblages, and of ceramics from the Winslow Anasazi, Cohonina, Southern Sinagua, Prescott, Mogollon and Hohokam groups shows trade over a large part of the Southwest (Baldwin and Bremer 1986:156-158). However, the nature of the relationship of the Walnut Canyon sites even to the Northern Sinagua is unclear. Walnut Canyon may be only a recipient of material culture and ideas from other areas, or it may represent a central place, such as Ridge Ruin. Physical and chemical analyses of ceramics and other artifacts

from existing collections, studies of architectural styles and of materials which can still be collected from surface and subsurface proveniences can help define the role which Walnut Canyon filled in the regional network.

The issues discussed above are broad topics around which future research in the Walnut Canyon archeological district can pivot. The specific questions and research problems subsumed under each issue are myriad. Data which have been recovered from extensive survey and limited excavation in the cliff dwellings have contributed much toward the current understanding of the Northern Sinagua. The wide variety of other site types in the district were inhabited at the same time, and are important in understanding the lifeways of the cliff dwellers more than 800 years ago. In addition, Walnut Canyon played a part in the larger network of sites in the Southwest. Information from past studies has increased our understanding of prehistoric archeology; more important is the potential for the ruins to contribute additional high quality data.

This concentration of small cliff dwellings is unique, and understandably is emphasized in the public interpretation of the monument. The ruins were the basis for the creation of the monument in 1915, and for the inclusion on the National Register, when it was created in 1966. The National Monument status of the Walnut Canyon archeological district insures that the significant potential of the sites is protected and someday can be realized.
