Fort Morgan Power Plant Building Morgan County, Colorado

FORT MORGAN POWER PLANT BUILDING

#### DESCRIPTION

The Fort Morgan Power Plant Building, a post-and-beam industrial building clad in brick, is prominently located on the southwest corner of Riverside Park, at the north end of Main Street, known historically as Fort Morgan's "Great White Way."

The Power Plant is a rectangular, three and one-half story structure with a stepped, flat roof bordered by decoratively crenelated parapets. All elevations of the building feature a rectilinear alignment of steel, industrial, center pivot windows framed by brick panels, the effect of which is to emphasize the structure's height and symmetry. The bays are enclosed with raised brick pilasters and raked parapets. Decorative brick panels and diamonds above the windows add interest to the flat walls. These repetitive elements frame the building and contribute to its architectural balance.

The original entrance on the main facade is no longer used, but it still retains its Tudor archway with multi-light transom, decorative terra cotta quoining, and sconces. Above the doorway is a panel incised with the name of the building: "City of Fort Morgan Power Plant." The rectangular composition with buff brick stringcourse below the first story windows continues around from the main facade to the sides of the building.

The north elevation reveals all three and one-half stories due to a drop in grade. The same window and wall design employed on the west (main) facade is repeated. The last two bays contain no windows and instead feature large panels surrounded with a single course of buff brick and topped with diamonds. A large drive-through entry with rolling door opens off the lower floor. Half of the entry is bricked in and contains a metal framed steel door.

The rear (east) elevation contains a two-story concrete coal bin that stretches across the full length of the building. The bins are accessible by trucks from the south elevation. A small, one-story brick lean-to runs the length of the coal bin and is topped with a shed roof. A series of openings provides truck entry. The main power plant wall contains windows only along the top floor with decorative brick panels below and diamonds above. The windows are covered with wood panels.

The south elevation resembles the north but reveals only the top two floors above grade. The last two bays are windowless with brick panels while the third contains a truck entry with rolling metal door with industrial sash windows above framed in decorative brick panels. A small one story switch gear room extends from the two westernmost bays and contains the style windows and brick work found throughout the plant.

		Fort Morgan Power Plant Building
Section number <u>7</u>	Page	Morgan County, Colorado

Modern, noncontributing steel transformer equipment sits in a yard area directly south of the gear room. The equipment is no longer operational. A small noncontributing greenhouse made of 2x4 lumber sheathed in plastic also shares the yard space.

The interior support for the power generating equipment at the Fort Morgan Power Plant is provided by massive concrete columns, beams and slabs. The even spacing of this post-and-beam structural system defines the interior space and, with its unadorned simplicity, delineates an architectural clarity for this definitively industrial space.

#### ALTERATIONS

Originally, the two-story front facade was divided into three equal width bays. The main entrance in the central bay featured a double-leaf doorway with six-light, paneled wood doors.

In 1930 the Power Plant building was expanded by two additional bays on the north side, which housed a new 2000 kW generator. The new wall replicated the design of the original except for a change in the parapets from raked to flat. The two rear bays, above the open basement level which housed the boilers and fireboxes, feature a flat brick facade detailed with buff rectangular panels instead of windows. The concrete coal bins on the east elevation were expanded. A one-story addition for the electric switch gear was added to the southwestern corner of the building in 1935. The addition retained the materials and architectural style of the original, deviating only in the use of glass block in place of the industrial multilight sash windows.

The present building is in good condition. The exterior remains largely unaltered. The original front doors have been removed and replaced with cement blocks covered with concrete. The original basement roll-up door has been modernized.

The interior of the building remains unaltered except for the removal of the power generating equipment. The electric switch gear addition has been converted to an office. The upper levels are used for storage.

Fort Morgan Power Plant Building Morgan County, Colorado

#### SIGNIFICANCE

The Fort Morgan Power Plant Building is significant under Criterion C for its embodiment of the distinctive characteristics of early 20th century industrial architecture. With its well developed proportion, mass, fenestration, and detail, the building is a distinguished example of technological and industrial development, as well as architectural design. In its design and details, the Power Plant building represents the most sophisticated exercise in publicly owned industrial architecture in Fort Morgan. Forming the northern terminus of Main Street, the Power Plant is a prominent local landmark.

Unusual in an industrial building, its flat facades, stepped parapet, vertical emphasis, and geometric elements were commonly used in commercial buildings of its period and foreshadow the Art Deco Style. The Tudor arch entryway, although somewhat incongruous, was an attempt to provide a suitably striking entrance to this public building, and it was in keeping with the various revival styles popular in the early 20th century.

George Cox, civil engineer and Fort Morgan's first city superintendent, designed the Power Plant building to house an array of large, complicated coal fired power generating equipment. He developed the design within tightly controlled spatial and structural parameters, using a sophisticated concrete post-and-beam structural system with exterior curtain walls. In doing this, Cox successfully integrated the intricate functional requirements of the interior spaces with an architecturally expressive exterior. Although the primary consideration for the design of the structure was operational efficiency in the generation of power, it was also intended to be pleasurable to work in and enjoyable to look at.

The extensive use of steel, center pivot windows with shallow aprons of brick represented a revolution in industrial window design in the early 20th century. Also at this time, reinforced concrete was clearly the state-of-the-art material for the construction of factories, warehouses, elevators and bridges. It combined the advantages of low cost, relatively quick erection and easy maintenance with a structural stability that was shockproof, waterproof, and fireproof.

The power plant utilized other modern elements of industrial design as well. Ample room, both horizontal and vertical, insured easy access to all equipment and interior spaces. Stairs were provided rather than ladders between the different levels of service walkways around boilers and other equipment. Upper level working platforms were built with curbs and guards to prevent tools from being pushed or dropped to the levels below. The south entrance to the building, which opened to all levels, allowed trucks and cranes access to both sides of the plant for maintenance. The spacious windows permitted natural light for visibility and fresh air for the employees.

The design of early industrial buildings was generally considered to be beneath the station of architects. The responsibility for these structures was thus assumed by civil engineers. With their bridges, dams, canals, exhibition halls, and railroad

depots, civil engineers forged a place for themselves in the industrial vitality of the country. Although often overlooked in favor of the more high styled municipal architecture represented by city halls and county courthouses, engineer designed industrial buildings such as the Fort Morgan Power Plant formed an integral and important part of the urban fabric.

George Cox, a civil engineer from Belle Plaine, Iowa, became Fort Morgan's first city superintendent in 1904. The municipal services were born and directed under the hand of Cox during his 36 years of service. The planning and designing of the Power Plant building was the pinnacle of his career. Other cities sought to emulate his record achievements for developing the city power and water systems, sewer system, curb and gutters, paving projects, parks and public building construction. He also served the state as municipal commissioner and became president of the Colorado Municipal League in 1930.

#### HISTORY

Located about 80 miles northeast of Denver, Fort Morgan has a history of vigilance and resourcefulness in reclaiming the plains and cultivating prosperous farmlands. In 1882, two railroads, the Union Pacific and the Burlington, passed north and south of the townsite, thus increasing the value of the area. In 1884, Abner Baker, founding father of Fort Morgan, completed the first irrigation canal from the South Platte River, which delivered life sustaining water to the economy of the region. That same year the town was platted, and by the end of the year five houses and a twenty room hotel had been built.

Fort Morgan continued to grow and expand as it became an agricultural center for the region. The Fort Morgan electrical department was organized in 1906, with \$6,000 in bonds and \$3,500 raised by subscription. The town board passed Ordinance No. 89, which authorized the municipal ownership of a lighting, power and heating plant for service of a population of 5,000. The Western Electric Company of Denver installed the first power plant that year for \$11,000.

The power was supplied by a 75 kW generator, which was run evenings only. A defining feature of Fort Morgan's lighting history was the policy of providing free power for residential porch lights. This innovation was adopted by the city administration in lieu of street lights, and Fort Morgan soon became known as "The City of Lights" on the northeastern plains of Colorado.

In 1908, when the plant was moved to the newly completed city hall building, a 100 kW turbo generator was added. The generator's capacities were increased to 250 kW and 400 kW, respectively, in 1920.

In 1923, under the direction of George Cox, the plant was moved to an eighty acre tract of land north of town, along the South Platte River. The new concrete Rainbow Arch Bridge had just been completed there, and the adjacent land was developed into Riverside Park, with a municipal swimming pool, picnic area, and playground. NPS Form 10-900a (Rev. 8/86) NPS/CHS Word Processor Format (Approved 03/88)

United States Department of the Interior National Park Service

NATIONAL REGISTER OF HISTORIC PLACES CONTINUATION SHEET

Section number <u>8&9</u>Page <u>5</u>Fort Morgan Power Plant BuildingMorgan County, Colorado

Designed by Fort Morgan City Superintendent George Cox and constructed entirely by city employees, the new plant was built for a cost of \$190,000. The Power Plant site was developed with landscaping that placed the power generating equipment above the flood plain of the South Platte River. It was situated adjacent to the Rainbow Arch Bridge (which is listed on the National Register of Historic Places) and near the Great Western Sugar Factory (1906), forming a cohesive industrial district and a visual anchor at the northern periphery of the city.

When the new plant was completed on December 21, 1923, Fort Morgan boasted about having the highest pressure steam plant in the state. Two Badenhouser high-pressure water tube boilers operated under a pressure of 325 pounds and 200 degrees superheat. Two 1000 kW Allis-Chalmers condensing turbines accommodated the demand for electricity. Three wells furnished cooling water for the condensers. The lukewarm water from the condensers was piped to the new swimming pool.

In 1930 a new addition was made to the building to house a new 2000 kW generator along with additional boilers, fire boxes and work areas. In 1935 a switch gear room for the control boards and switching equipment was added. However, by 1950, power was generated at a lower rate by the Bureau of Reclamation from its 5000 kW substation located east of the Power Plant. The city plant continued to be used as an auxiliary system until 1952, when it was closed and the machinery sold to a steel mill in Lima, Peru. Today, the Power Plant building is used by the city parks department as a maintenance and storage facility.
