ECLIPSES IN THE YEAR 1874.

IN the year 1874, there will be four Eclipses, two of the Sun, and two of the Moon, and a transit of Venus over the Sun's disc.

I. — A total eclipse of the Sun, April 16th; visible to the southern portions of South America and Africa.

II. — A Partial Eclipse of the Moon, May 1st; visible to parts of Asia, Africa, Australia and Sandwich Islands.

Magnitude of Eclipse = 0.833, (Moon's diameter = 1).

III. — An Annular Eclipse of the Sun, October 10th; visible to Europe and parts of Asia and Africa.

IV. — A Total Eclipse of the Moon, night of October 24th — 25th; visible to North and South America and Sandwich Islands.

The Eclipse will occur in Boston time, as follows:

	d	h	m
Moon enters Penumbra,	25,	0,	0, A. M.
Moon enters Shadow,	25,	0,	58, "
Total Phase begins,	25,	2,	16, "
Middle of Eclipse,	25,	2,	33, "
Total Phase ends,	25,	2,	49, "
Moon leaves Shadow,	25,	4,	7, "
Moon leaves Penumbra	25,	5,	5, "

Magnitude of Eclipse = 1.053 (Moon's diameter = 1.)

Note. — To find time of occurrence at any other place, correct by difference of time between the place and Boston.

V. — A transit of Venus over the Sun's disc, Dec. 8th visible entire to Eastern Asia and Australia and in part to Africa, and Sandwich Islands.

A transit of Venus furnishes the most accurate method for determining the distance of the Earth from the Sun. The last occurrence of this Phenomenon happened in 1769, when exhibitions on the most extensive scale were fitted out by the larger civilized governments of the world, for the purpose of observing it. The highest interest attaches to this present occurrence, as from some independent reasons, it is suspected that the Sun's accepted distance is too large by about two millions of miles.
