DESCRIBE THE PRESENT AND ORIGINAL (if known) PHYSICAL APPEARANCE

Mounds State Park is located on a bluff overlooking the West Fork of the White River. The total archaeological site may have contained at an earlier time as many as 15 aboriginal earthworks, but highway construction and cultivation have destroyed some of them. Eight mounds are presently definable within the park. Immediately prior to the area's acquisition by the State of Indiana in October, 1930, the region had served as a park for a local transit company. A number of amusement rides were constructed in the area of greatest mound concentration and at least one of the tumuli was severely damaged though it is yet visible. Others are well preserved.

The most striking of the earthworks are in the form of geometric enclosures. Construction was accomplished by excavating a trench into the soil and depositing the removed earth to the outside of the trench to produce a walled enclosure: circular (2), rectangular (1), panduriform (3). Commonly a narrow sector of the trench was unexcavated producing a ground level entranceway into the central region of the earthwork.

The largest of these features (A) is circular in ground plan and averages 360 feet in diameter. The defining trench was excavated to a depth of about nine feet and the encircling wall is presently approximately six feet in height. An opening to the south-southwest provides an entranceway to a central platform upon which was constructed a low mound. This later feature was a two-stage burial mound and there is additional evidence for a charnel house having been present.

In the immediate vicinity of this well-preserved impressive enclosure are other features constructed in a similar fashion, though they are smaller in size: circular (1), panduriform (3). The largest of the latter (H) measures approximately 180 feet by 120 feet. There is some suggestion that two low mounds may have been present within the two lobes defined by the shallow trench and low wall.

Also, two earth mounds were at one time located northwest of the large circle, but only one of these can presently be located with accuracy. Earlier reports suggest it, too, may have been an enclosure, but this is not apparent at present.

Approximately 1500 feet northeast of the major group is a large rectangular enclosure. Earlier reports indicate that two mounds formerly were present on each side of the entranceway, but no evidence of these remain.

STATEMENT OF SIGNIFICANCE

The significance of archaeological features in Mounds State Park is apparent at several levels.

1. The site, while still somwhat altered from its original condition, nevertheless is one of the better preserved stations representative of the widespread ceremonialism which occurred during the Middle Woodland Period (300 B.C.-A.D. 500) in the Eastern United States. It is also one of the few surviving sites of its kind fromerly present in the immediate area.

2. Recent excavation at the site, while defining its placement within the above period, has succeeded in identifying a somewhat unique complex of traits representative of a highly restricted localized variant of this larger pattern. Therefore, it is of the highest priority that the archaeological features be preserved in order that a fuller future understanding of this variation might be possible.

3. The panduriform enclosures are rare, the only other recorded examples occur in adjacent Henry County.

4. It is the only site of its kind in the Eastern United States readily accessible to the public.
