DESCRIBE THE PRESENT AND ORIGINAL (if known) PHYSICAL APPEARANCE

On April 4, 1912 the Chehalis <u>Bee Nugget</u> announced the Northern Pacific Railroad's intention to construct a new depot in that city "built of brick, cement and stone, with a slate roof." It was to be fireproof "or nearly so", and the waiting rooms would be finished in "enameled brick". The building was completed that summer.

The Chehalis Passenger Station is a long, one story facility built on grade with a rectangular plan approximately 45' by 160' running parallel to the tracks. It is divided into five roughly equal parts that are each visually differentiated by exterior massing. The majority of the roof over the central portion of the building is a medium pitch gable with parapet gable ends at points one-fifth and four-fifths down the overall length. These parapets slope upward from flat pedestals to a semi-circular detail over the ridge with corbeling and some decorative brickwork. The remaining sections at opposite ends of the station have 3/4 hip roofs with a slightly shallower pitch. These are attached under the parapets a few feet below the ridge of the main roof. At one end adjoining the waiting room, this last section is an open porch supported by six piers, three to a side with two engaged to the building. Corresponding to this at the other end is an enclosed freight office attached to the baggage handling area and its walls are set inward to further emphasize the division. In the middle of the depot is a cross gable with its ridge slightly higher than the long ridge, and parapet gable ends that are both extended a few feet beyond the plane of the main building rectangle as established by the walls of the flanking waiting area on one side and baggage handling room on the other. Within this space under the cross gable is the railroad office and telegraph room, which is conveniently located to serve passengers and supervise baggage and freight with a minimum of intervening hallways. The central third of the cross gable end facing the tracks is a rectangular bay window with windows in the narrow wall sections on either side looking down the tracks in both directions, positioned so that office personnel can observe approaching trains.

The main roof has a slight bellcast at the overhang, which is more nearly equal to the pitch of the hip portions attached on its ends. The overhang extends beyond and around the parapet gables in such a way that the cornice is at the same height and continuous around the building. It is also extended across the face of the cross gable ends sloping up and back until intersecting the vertical surface. The overhang follows various projections or set backs of the wall responding to the changes in its plane and maintaining the same width of soffit throughout.

There is a stone base course with a stone belt course a few feet above it, both of which are continuous along all of the walls SEE INSTRUCTIONS

#7 - Description Burlington Northern Depot

interrupted only by doorways. The windows rest on the belt course, and they are generally double hung with a fixed transom divided into panes. Most windows are placed at frequent regular intervals except in the baggage area. There are large sets of double doors for both the baggage area and the freight area with full width multipane transom windows. The waiting room has three doors with two on opposite sides and one sheltered under the porch.

The waiting room interior has a cove ceiling of an unusually large radius, and decorative neo-classical pilasters that are continued as ribs crossing the room in both directions overhead. The white glazed, chest-high wainscoting and terrazo floors are easily cleaned, minimizing maintenance costs.

Stenciled around all sides of the porch support piers are the words "DO NOT SPIT".

The station remains in good condition with little apparent alteration.

STATEMENT OF SIGNIFICANCE

The people of Chehalis were enthusiastic about the planned construction of their new depot. The <u>Chehalis Daily Nugget</u> expressed this in a September 13, 1912 edition: "The new station will be beautiful when completed. It will be a great credit to Chehalis and the Railroad Company".

The depot was in an ideal location since all the railroad traffic between Portland, Oregon, and Seattle, Washington, passed through the twin cities of Chehalis and Centralia. Near the center of the Chehalis community, it was a determining factor in the city's commerce, and served as a focal point for communication. Chehalis also supplied the residents of such small outlying communities as Vader, Winlock, Napavine and Tenino, which were all connected to Chehalis by the railroad.

The Chehalis Depot remains as a reminder of the enormous impact railroads once had on the location and growth of towns. It is a good example of the architectural style once used in the construction of depots in the state's medium sized communities. The depot's presence on the downtown Chehalis landscape is a distinctive historical asset, and it serves as a focus for the central business district. A number of the "giants" in the prosperous years of the West Coast railroad industry used this depot - including the Northern Pacific, which built the depot, the Great Northern, which rented space in the station, and the Union Pacific, which connected with San Francisco.

The site on which the depot is located had already achieved significance several years before the station was constructed. In anticipation of a reception for President McKinley, a giant stump, cut from a tree logged near Pe Ell, Washington, was placed at the site, and was to serve as a speaker's platform for the president. However, McKinley cancelled or postponed the planned visit, and the stump remained unused. On May 23, 1903, President Theodore Roosevelt arrived in Chehalis and delivered a speech from this now famous podium. Later, although not yet president, William Howard Taft also spoke from the stump. Although it is now preserved some two miles away, the townspeople plan to return the stump to its historic location
