Describe the present and original (if known) physical appearance

altered

Primrose Mill (1871) is a well preserved and most unique example of a steam-powered rural grist mill, built large in scale and with much attention to both detail and design.

The three-story brick mill (laid in running bond) has a rectangular plan and a combination gambrel-jerkinhead roof which is very unusual. A full raised basement with walls composed of 18" limestone ashlar blocks, supports the brick structure. Side and end windows are in line with those in the upper stories, and are bridged by semisegmental arches composed of stone voissoirs. On the main facade, the original sash pattern was 9/6 with a larger upper sash. Two half windows are located on the first floor, east side above the original shed roof line of the power plant building which is no longer extant. Doors are centered on both floors of the south end (in "warehouse" fashion) and on the first floor of the west side. All doors and windows have limestone sills, and segmental arched headings (composed of two courses of rowlock arches).

A frieze of corbelled brick with dentil pattern and corbelled cornice traces the eaves line around the building. This cornice is partly returned at each corner. A gothic gable roofed dormer with a tall arched double-hung window is centered on each side above the eaves line.

The mill is internally supported by four vertical 9" by 9" wooden posts on each floor. Paired tie rods with star bolt plates reinforce each floor between ends and sides of the building. The star bolt pattern is symmetrical on all four facades, but fenestration is symmetrical on all save the east face of the building wherein the pattern is shifted to the north.

A single story gabled cider press building was located just north of the grist mill but was moved to Farmington in 1975. A mill pond remains to the north of the mill (not on the subject property at present). Apparently the pond supplied water for the steam engine.

The building, although vacant, is in sound structural condition. The first story window on the northwest corner of the west face has been enlarged into a door. Vents have been inserted into several windows on the east face. A barn-style roof vent has been centered on the ridgeline. A two-story (orginally single story) brick power house with shed roof, once located along the east face of the mill, is no longer extant. Iron anchors which once stabilized the iron smokestack by anchoring guidewires remain in the east face.

The mill is located on the eastern edge of the village of Primrose and is the most prominent structure in the area, and is the only one built in brick.

Statement of Significance (in one paragraph)

Primrose Mill is historically significant as an example of the importance of a grain mill to a small Iowa community and further as an example of the use of steam power as a source for energy for a mill in a sparsely settled region. The mill's operating history attests as well to the rapid turnover of operators which this profession suffered.

J.W. Pierce (1841-?), born in Prussia, emigrated to the United States in 1861 and settled in Primrose in 1868 where he became a retail dry goods merchant. In 1871, in partnership with Mr. Kumleh, Pierce built the steam powered Primrose flouring mill. By 1874, the partnership included Mr. Bruhne. Pierce's mercantile business failed in 1875, but with community assistance and support he was able to remain in business through at least 1880, but his involvement with the mill had ceased. The 1880 Federal Population Census identified Charles Ross, from Pennsylvania, as the miller as of June 1 of that year, but the Industrial Census for that same year listed the German born William Rakow (1843-85) as miller. Rakow was still operating the mill as of 1885 according to the State Census of that year. August C. Kiehbiel, a local Mennonite, was miller in 1895, his son Peter was the engineer in the power plant and another son, Edward worked in the mill as well. By 1900, Simon Rasch was the miller. Despite this apparent rapid turnover, the continuous milling operation attests to the need felt by the village and township for the services of a mill.

In 1880 the mill employed three hands for the entire year, and had a maximum daily capacity of 300 bushels of grain which were processed through four runs of grinding stones. A forty horsepower engine provided the power. During the year ending June 1, 1880, the mill produced 2,400 barrels of wheat flour, 2,080 barrels of rye flour, 3,000 pounds of buckwheat flour, 20,000 pounds of cornmeal, and 470,000 pounds of feed. The mill offered commercial and custom grinding.

Primrose Mill is closely identified with the German portion of the Primrose community. The original builders were German born, perhaps explaining the high degree of craftsmanship and attention to decorative elements which characterize the building. The village of Primrose, despite its small size (1887 population of 175) boasted both a German Lutheran and a Presbyterian church.

The market area served by the mill was probably larger than the Township of Harrison in which it was located. The willingness of enterpreneurs to invest in a steam powered multi-storied brick mill in an area that was close to water power sources (Des Moines River, six miles to the southwest) indicates the great importance which was placed upon obtaining a mill for each local community. While the use of steam power for milling purposes was already a thirty-year old technology even in Iowa, its application in this setting over a thirty plus year period is of historical interest.
