Potosi is a camp and a mine. The mine is high on a juniper and pinion covered hill and its portal is on the west face of an almost perpendicular cliff 150 feet high, near the summit of Potosi Mountain. The camp is at Potosi Spring, a half-mile north and 700 feet in elevation below the mine.

A large wooden structure containing various types of mining machinery stands at the entrance to the horizontal shaft. Around part of the hill are the remains of the mining-gauge railway installed at a later date to carry the ore to a point opposite the shaft side of the hill, where it was loaded into buckets and lowered by cable to the bottom. The hoisting equipment is difficult to reach, as it is located at the top of an 800 foot hill.

A half-mile north of the mine and 700 feet below it is the camp at Potosi Spring. Only foundations remain of this small camp.

The area is characterized by scenic yellow sandstone formations, pinion-juniper and Joshua tree plant life. Petroglyphs, mescal pits, and rock shelters are in evidence in the area.

The Potosi lead-silver mine is probably the oldest lode mine in Nevada. The desire of the Mormon settlements for economic self-sufficiency led to prospecting by missionaries for lead. In April 1856, Nathaniel V. Jones was sent by Mormon leader, Brigham Young, to recover ore from the "mountain of lead" 30 road miles southwest of the church's mission at Las Vegas Springs.

Wood was plentiful and running water was 12 miles away. A spring for camp purposes was located within 1½ miles. On August 21, 1836, Jones started his lead mining operation. By the 10th of September a furnace had been built and smelting started. It was soon found that the material from which the furnace was constructed could not stand the blast. Jones, with the first wagon load of ore, set out to obtain supplies in Salt Lake City. He returned to the mine on December 9 and, beginning on Christmas Day, the new furnace began smelting ore.

Mining difficulties, however, beset them. The richer ore was soon gone and the poor grade, too flaky and brittle, was hard to process. Fuel was fast becoming scarce, as it was then necessary to haul wood a distance of seven miles to keep the furnace going. A shortage of provisions both for men and animals was a constant problem and supplies had to be hauled 230 miles from Parowan and Cedar City, Utah.

Not more than a dozen loads of lead, or about 9,000 pounds, were recovered before processing difficulties forced the remote mining camp to be abandoned in January 1857. Potosi thus became the first abandoned mine in Nevada.

Briefly reopened from 1861-1863 as a source of silver, more extensive operations were made possible in 1905 by construction nearby of the Los Angeles, San Pedro and Salt Lake Railroad (now the Union Pacific).

Between the years 1913-1917 Potosi was Nevada's largest zinc producer and during World War I it was an important source of this product.

Activity by lessors in later years helped push Potosi production to an estimated \$41.5 million. The mine at Potosi supplied lead, silver, zinc, and other valuable ores over more than a century of development.

Historical marker number 115 marks the site of Potosi.
