DESCRIBE THE PRESENT AND ORIGINAL (if known) PHYSICAL APPEARANCE

There have been no alterations made to this bridge since it was constructed. It was built of concrete with iron or steel rods being used as reinforcing material. The concrete is of a natural color and there is no evidence that retainer walls and forms were first constructed of lumber and then filled with concrete.

The bridge is twenty feet wide, inside dimension, which conformed to the Alabama Road Commission's original specification on width of highways and bridges. This specification was made in 1911.

The span of the arch is 35 feet; the distance from the top of the bridge to the surface of the water below is 21 feet. The guard rails on both sides of the bridge are 35 feet in length, 7 inches thick, and reach a height of 4 feet above the inside surface of the roadbed. They are of solid concrete and contain rectangular indentions both inside and outside for visual relief of the smooth surface. Both ends of the bridge have concrete retaining wings. These wings are 8 feet long and slope gradually from the bottom of the side rails to the ground.

Five Mile Creek Bridge is one of the few remaining examples of early concrete arch bridges left standing in Alabama. The bridge spans Five Mile Creek in western Jefferson County, and marks one of the few remaining segments of the original Huntsville Road which was one of the first roads to penetrate the rugged interior of North Alabama as land became available for settlement in 1816.

This structure is a good example of early reinforced concrete engineering and construction techniques. As all of the materials for the manufacture of steel and concrete are found in this area, all of the construction materials for the bridge were locally made.

Although concrete is the oldest synthetic building material known to man and dates back at least 4500 years its use as a bridge building material is comparatively recent. The use of concrete was limited because of the unavailability and unreliability of the quality of quicklime for cement in many areas. This problem was resolved by Joseph Aspdin's invention of the Portland cement process in 1824 which produced both a superior and reliable product.

In the 1860's reinforced concrete was invented in Europe. The use of iron or steel rods or webbing gave concrete great tensile strength in addition to the compression strength of regular concrete.

When Five Mile Bridge was built the use of reinforced concrete in bridge construction was still in its infancy. The first reinforced concrete bridge in the United States had only been built in 1889. It was the Alvord Lake Bridge, Golden Gate Park, San Francisco. Until after the turn of the century most concrete bridges were stone veneered both for strength as well as beauty as most engineers were more confident in the old masonry construction than the newer concrete.
