Describe the present and original (if known) physical appearance

Built in 1906, the two story Cronkhite Ranch House was constructed of 9 inch by 14 inch solid cement blocks. Of rusticated ashlar design, the blocks were formed at the site and manufactured from local materials. The single walls of the house were placed on massive foundations of cement poured into deep V-shaped trenches. Four single, double sash windows--two upper and two lower--were symmetrically placed around the north side entryway. On the east end there were two single, double sash windows and an asymmetrically placed entryway on both lower and upper levels. The north side contained two sets of double paired windows on the bottom floor and one set of double paired and a single window on the second floor. The west end had two upper and two lower windows with an symmetrically placed lower level entryway. On the east, north, and west ends were full porches, with the roof, enclosed by rails, serving as a second story balcony. The west end porch was screened. Two interior chimneys protruded from the deck of the hipped roof, which was itself covered with tin sheets. Upon completion, therefore, the house was faintly Italianate in design and with the exception of its cement, block walls not unlike other two story houses of prosperous farmers and townspeople in the county.

In 1936 four additions were made to the house. To the east end was added an upper level sleeping porch; on the north side a small portico over the entryway replaced the veranda; on the west end and to the rear a kitchen and dining area was added; and the hipped roof was replaced by a single ridge, gabled one. Because the additions were constructed of materials identical to those used originally, the Cronkhite Ranch retained its basic architectural integrity.

Specific dates 1906 **Builder/Architect** Will Cronkhite

Statement of Significance (in one paragraph)

Initially a part of the Cheyenne-Arapaho Reservation, what is now Blaine County, Oklahoma, was opened to white settlement in a famous land run in 1892. Because the canyon country in the western portion of the county was unsuitable for farming, that region was utilized principally for cattle ranching. Allotments reserved for the Indians were frequently located in that area as well. White ranchers generally entered one 160 acre tract according to the Homestead Laws, built a home on that tract, and then put an extensive cattle range together by leasing surrounding Indian allotments. This was the pattern followed by Will Cronkhite. Thus his Ranch House is suggestive of the settlement and agriculture patterns typical at the turn of the century in western Oklahoma. Moreover, it is the only remaining imposing structure associated with the ranching industry dating from that era in Blaine County.

The Cronkhite Ranch House is significant architecturally not because of its design as much as its method of and materials used in its construction. To the north of the house lies one of the purest deposits of gypsum in the United States. Will Cronkhite and his brothers pioneered in the exploitation of the mineral in 1904 by establishing a mill and quarry some two miles northeast of the house site. Material from the mill formed the cement blocks from which the house was fashioned. Only one other house is known to be constructed from similar materials, and it is located several miles south in the community of Watonga. The Cronkhite House, therefore, is a prime example of early inhabitants of a region using uniquely local materials for construction purposes.
