Describe the present and original (if known) physical appearance

The Williams Bridge is located in Lawrence County on County Road 1000 West, one mile southwest of Williams, Indiana. Built by J. J. Daniels in 1884, the two-span bridge is of the Howe truss design and spans the East Fork of the White River.

The structure is 376' in length, with an additional 13' of overhang at each end. According to Bryan E. Ketchum, Covered Bridges on the Byways of Indiana, the bridge is 16' wide and 12' 6" high. Abutments at either end are made of cut stone. A central support pier is also of rockfaced stone, laid in a regular ashlar pattern.

Covering the important structural members of the bridge are strips of vertically placed, wooden board siding. Pieces of the siding are now missing, leaving certain structural members exposed. The siding stops short of the bridge's upper chord to allow the entry of light and ventilation. The structure is covered by a gabled roof sheathed in sheet metal with slightly projecting eaves. The portals are square in shape with rounded corners. The bridge has had no alterations since its construction.

The Williams Bridge is the only extant example of a Howe truss bridge built in Indiana by J. J. Daniels. It utilizes the wrought iron, vertical rod, which adds tensile strength to the otherwise entirely wooden structure.

Statement of Significance (in one paragraph)

The Williams Bridge is significant as the longest covered bridge in Indiana still in use, and as the only surviving example of a Howe truss bridge built in Indiana by J. J. Daniels, one of the state's foremost bridge builders.

According to George C. Gould, Indiana Covered Bridges Thru The Years, Daniels preferred to use the Burr Arch truss but was occasionally forced by competitors or desires of county commissioners to use the Howe truss. Of the 47 bridges which he built in Indiana, only two were of the Howe truss type.

The 376' Williams Bridge is surpassed in length only by the 434' Medora covered bridge, a Burr Arch construction in Jackson County, built also by J. J. Daniels, which was by-passed in 1972. The Massillon Bridge Company, Massillon, Ohio, executed the construction of the Williams Bridge in 1884, at a cost of \$18,700.00. The structure was named for Isaac Williams, founder of the nearby town.

The Howe truss was patented by William Howe in 1840. The discovery that metal functioned as a better tension member than wood led to the introduction of the wrought iron vertical post to the all-wooden truss. This introduction of metal as a tension member, while using the wood as compression members, was the essential feature of the Howe truss design, and was an important step toward the development of the all-metal truss.
