DESCRIBE THE PRESENT AND ORIGINAL (If known) PHYSICAL APPEARANCE

The New Castle and Frenchtown Railroad originally crossed the Peninsula from a wharf in New Castle to a wharf at Frenchtown on the Elk River in Maryland. Part of the original route, from the Delaware Railroad near Porter to New Castle, still is in operation as part of the Penn Central system. From Porter to Frenchtown, the right-of-way is abandoned for railroad purposes, although parts of it serve as country roads.

Much of the abandoned right-of-way survives as a trace along field boundaries and through second-growth woods. At Belltown Run, west of Delaware Route 401, a stone-arch bridge survives in good condition. Delaware Route 394, near the Maryland line, is built on part of the roadbed. At Frenchtown, the long curving roadbed to the Elk River survives as a county road; another portion of the roadbed east of Frenchtown is a private lane that connects with Route 213.

The most evident surviving portions of the railroad are in the valleys of small streams, where earth-fill embankments survive. The long causeway across the valley of Belltown Run is the largest of these.

Like many early railroads, the New Castle and Frenchtown was built on stone sleepers that carried the strap-iron rails. This system proved unsatisfactory, and by the middle of the nineteenth century had been abandoned in favor of wooden ties. Stone sleepers from the New Castle and Frenchtown, salvaged by local residents, may be seen today in the foundations of buildings mean the right-of-way.

STATEMENT OF SIGNIFICANCE

svstem.

During the seventeenth and eighteenth centuries, the

Chesapeake and Delaware drainages were the principal avenues of
settlement in the middle colonies. Although they were separated by
only a narrow isthmus, their political and economic histories
followed different courses. Passage across the land barrier was
tedious at best, even as late as the beginning of the nineteenth
century. Although the portage was only five or ten miles wide
in places, shippers usually preferred to take the dangerous sea
route between the two bays.

As early as the middle of the seventeenth century, entrepreneurs were proposing canals, turnpikes, and other internal improvements to connect the two bays. A century and a half later, however, the portage still involved poor roads, undependable packet connections, and long delays. Albert Gallatin, in his 1808 report to Congress, recommended a series of canals that would eliminate the portages and connect New England with the South by an inland water passage. Gallatin's recommendations were eventually carried out, but not by Congress. Independent companies built canals, turnpikes, and railroads, helter-skelter, along the East Coast, first to connect major waterways, and finally to provide a single land transportation

8. SIGNIFICANCE (continued) ---

While the present coastwise transplantation network was evolving, dozens of companies built turnpikes, senals, and railroads that enjoyed a brief prosperity, only to be superseded in a few years by newer and cheaper routes. The New Castle and Frenchtown Railroad was one of these ephemeral schemes.

As early as 1775, there was regular stage service between New Castle and Frenchtown, a jolting seventeen-mile passage over unimproved county roads that connected with the relatively comfortable packet boats on the Delaware and Elk rivers. By 1811, the demand for an improved road between the two rivers led to the construction of a short turnpike from New Castle to Clark's Corners, a distance of about three miles. successful completion of this turnpike revived interest in the proposal for a New Castle and Frenchtown turnpike, which had been chartered in 1809 but never organized. Delaware and Maryland rechartered the New Castle and Frenchtown company in 1813, and by 1816 it had built a fifteen-mile road from Clark's Corners to Frenchtown. Until the Chesapeake and Delaware Canal was opened in 1829, the turnpike from New Castle to Frenchtown was the principal route over the portage. The success of the Frenchtown route encouraged the Elkton and Christiana Turnpike Company, which built a competitive road to connect the head of Elk River with the head of the Christina. This competition hurt the Frenchtown company, which was dependent almost entirely upon the transpeninsular stages operated by the Union Line of steamboats.

8. SIGNIFICANCE (page 2)---

In 1821, the turnpikes suffered another blow when the Delaware General Assembly levied a tax on them to support the proposed college at Newark, denounced as "a small village in an obscure corner of this state, where it is impossible it can ever flourish." The tax was repealed the following year.

By 1827, it had become apparent that the canal across the isthmus would be completed, and would siphon away the stage traffic that supported the Frenchtown road. The turnpike management began to investigate the prospect of building a railroad; a few miles to the north, citizens of Wilmington proposed to build a rail line from that city to Elkton. The Wilmington interests got their Maryland charter, and a few months later the Frenchtown company obtained permission to expand its own operations to include a railroad in Cecil County. the Delaware legislature met in 1829, it failed to charter the Wilmington road, but passed acts that permitted the New Castle and Frenchtown turnpike companies to build railroads. By March 1830, the two companies had raised enough new capital to permit them to build railroads. The next month, the short New Castle Turnpike was merged into the New Castle and Frenchtown Turnpike and Railroad Company. The chief engineer was John Randel, Jr., who had designed the C&D Canal, but had no experience with railroads. Randel laid out a route, a few hundred yards south of the turnpike, which was under construction by July.

On February 28, 1832 the railroad opened for passenger service, using horse-drawn carriages because its temporary rails were too light for

8. SIGNIFICANCE (continued-3)---

locomotives. By September 10, English-built steam locomotives were operating on an improved roadbed. During the following year, the railroad absorbed the Steam Navigation Company, which operated packet boats to the line's termini. A competing steam packet line, operating through the canal, forced the railroad to charge unreasonably low fares that weakened its financial structure. By 1834, however, the competition had been put out of business, and the railroad enjoyed a monopoly on the passenger-carrying trade that lasted until 1837, when a new railroad network between Philadelphia and Baltimore was completed. The New Castle and Frenchtown tried to compete with the new line until 1843, when it became a subsidiary of the Philadelphia, Wilmington and Baltimore Railroad. A spur to Wilmington, chartered as the New Castle and Wilmington Railroad, was completed in 1852. In 1855, the Delaware Railroad built a connection with the New Castle and Frenchtown east of Glasgow.

The line west of the junction, subject of this nomination, was abandoned after service to Exenchtown wharf was discontinued.
