## **National Register of Historic Places Registration Form**

767

This form is for use in nominating or requesting determinations for individual properties and districts. See instructions in *How to Complete the National Register of Historic Places Registration Form* (National Register Bulletin 16A). Complete each item by marking "x" in the appropriate box or by entering the information requested. If an item does not apply to the property being documented, enter "N/A" for "not applicable." For functions, architectural classification, materials, and areas of significance, enter only categories and subcategories from the instructions. Place additional entries and narrative items on continuation sheets (NPS Form 10-900a). Use a typewriter, word processor, or computer, to complete all items.

**Narrative Description** 

(Describe the historic and current condition of the property on one or more continuation sheets)

Located 3.5 miles northeast of Madrid, the Big Creek Bridge spans Big Creek in a rural Boone County setting that has changed little since the structure's period of significance. A description of the structure follows:

span number: 1 construction date: 1917

span length: 50.0' construction cost: \$3170.00 (contract amount)

total length: 53.0' current condition: good roadway wdt.: 18.0' alterations: none

superstructure: concrete, 6-panel, fixed Marsh arch substructure: concrete abutments and wingwalls

floor/decking: concrete deck

other features: tapered concrete arch ribs; concrete hangers, cast integrally with concrete floor beams;

slotted concrete guardrails with paneled concrete bulkheads

Other than maintenance-related repairs and alterations noted above, the bridge remains essentially unaltered as it continues to carry vehicular traffic. The Big Creek Bridge today retains a high degree of integrity of location, design, setting, materials, workmanship, feeling and association.

Paperwork Reduction Act Statement: This information is being collected for applications to the National Register of Historic Places to nominate properties for listing or determine eligibility for listing, to list properties, and to amend existing listings. Response to this request is required to obtain a benefit in accordance with the National Historic Preservation Act, as amended (16 U.S.C. 470 et seq.).

Estimated Burden Statement: Public reporting burden for this form is estimated to average 18.1 hours per response including time for reviewing instructions, gathering and maintaining data, and completing and reviewing the form. Direct comments regarding this burden estimate or any aspect of this form to the Chief, Administrative Services Division, National Park Service, P.O. Box 37127, Washington, DC 20013-7127; and the Office of Management and Budget, Paperwork Reductions Projects (1024-0018), Washington, DC 20503.

## National Register of Historic Places Continuation Sheet

Section Number 8 Page 1 Big Creek Bridge Boone Coun	ıty; iowa
---	-----------

Consisting of a short-span fixed Marsh arch on concrete abutments and wingwalls, this bridge carries a gravel-surfaced county road over Big Creek in Garden Township, northeast of Madrid. This structure was designed in February 1917 by James Marsh, the Des-Moines-based civil engineer who designed and patented the rainbow arch configuration. A contract to build the Big Creek Bridge was awarded in April 1917 to the N.E. Marsh & Son Construction Company of Des Moines, Iowa, for \$3170.00. N.E. Marsh, James Marsh's brother, completed the structure later that year. It has functioned in place since that time, in unaltered condition.

This small-scale arch marks a noteworthy innovation in bridge design, an achievement engineered by James Marsh, the bridge's designer and patent holder. Marsh's design represented the hybridization of continuous concrete and segmental steel-arch designs. This marked a radical departure from standard engineering practice. Concrete can withstand a nominal amount of tension. For this reason, most previous concrete arches - both reinforced and mass arches in filled and open spandrel configurations - had been built with the arch below the deck, where the downward force of the deck could be carried in compression by the arch ribs and spandrel wall or columns. Marsh's suspended arch reversed this.

His arches, of course, acted in compression. But the hangers and floor beams carried the deck in tension. Furthermore, the novel treatment of the deck over sliding steel plates on the floor beams and the use of pin-connected, articulated steel hangers for the end panel points were devices more suited to steel construction than concrete. To make the concrete thus act against its nature, Marsh inserted large amounts of structural steel. His bridges may have looked like concrete spans, but the arch ribs and hangers carried such heavy and complicated reinforcing that they were, in reality, steel structures encased in concrete. Marsh designed his bridges with either tied (with the arches attached to the abutments at the floor beam level) or fixed (arches extending below the floor beams to the abutments) configurations. Aside from this, all of his rainbow arches were similar, varying only in span length, arch rise and number of hangers.

Marsh's invention did not foretell a new direction in reinforced concrete design. The industry would later turn to other, simpler slab and beam configurations as it developed more sophisticated reinforcing techniques in the 1930s and 1940s. The rainbow arch did, however, denote one of the more interesting early experiments in concrete engineering and represented the proliferation of concrete for road and bridge construction. It is not known how many Marsh arches were built in Iowa in the 1910s and 1920s: judging from county records, perhaps not more than one hundred. The large amount of reinforcing steel sheathed within a relatively thin skin of concrete has made them particularly vulnerable to rusting and spalling. As a result, only eleven are known to remain. One of seven Marsh arches in Boone County, the Big Creek Bridge is distinguished as a well-preserved example of an indigenous structural type.
