Describe the present and original (if known) physical appearance

The J.R. Allen house in Draper was designed by Richard K.A. Kletting (1859-1943), one of the early important architects of the intermountain area. Most noted for his design for the Utah State Capitol Building (1912), he is also remembered for many other public, civic, commercial, religious and private structures in Utah, Wyoming and Montana. Built in 1899-1900, the Allen house is a two and half story brick structure with a granite foundation. The plan is rectagular, with projecting bays on front, sides and rear. In scale, proportion, and massing the structure reflects a Box Style scheme, though the plan is more asymmetrical and vigorous than the typical Box Style plan. The Allen family built a frame home using the same plans at Charleston, Utah. Several of the Allen brothers resided there to be nearer their herds. This facsimile of the Draper house was destroyed during the construction of the Deer Creek Reservoir.

From the central hipped roof mass, hipped roof bays project at front and sides. The hipped roofs are flared. Decorative rafters are exposed. A gabled bay projects in the rear. Side bays are three sided, while the front bay is segmentally curved. A variety of dormer shapes are displayed, including hipped roof, gabled, eyelid (east) and triangular (north).

On the primary elevation is a one story porch. The base of the porch is shingled with central balustrade piercings. Tuscan columns support the flat roof which makes a balcony open from the second story level. A molded cornice conributes to the Classical allusion. A smaller, single story, rear porch has a hipped roof, wood posts and rectangular balusters.

Windows are generally double hung sash, though some variations occur. Transoms for second floor windows have leaded glass panes arranged in a geometric pattern. The six original stained glass windows are intact; all are transom windows except for an oval light in the parlor. Sills and lintels are massive elements of dressed stone, forming continuous stringcourses on the bays.

The interior of the first floor includes a parlor (dining room), sitting room, bedroom and kitchen. These spaces are located around the large central stair hall. The second floor was given to bedrooms and a bath, and is similar in plan to the ground floor. The plumbed interior bathroom is early for the area. The attic was left open, lit by dormer windows. A skylight lights the staircase and central hall.

The Allen family depended for their livelihood on the Cotswold. Appropriately, insulation for the eighteen inch space between floor and

Statement of Significance (in one paragraph)

This house is architecturally significant as one of the few remaining examples of R.K.A. Kletting's domestic architecture. Kletting (1859-1943), one of the early important architects of the intermountain area was most noted for his design for the Utah State Capitol Building (1912), and is also remembered for many other public, civic, commercial, religious and private structures in Utah, Wyoming and Montana. Few historic homes have important photographic documentation and original plans available for study as does this one. The completeness of the historical and physical fabric of the Allen House and outbuildings multiplies its importance architecturally. It is also significant as the home of Jackson R. Allen, a prominent and innovative stockman. He lead in introducing blooded stock to improve local herds of both cattle and sheep, being especially interesed in Short Horn cattle and Cotswold sheep.

Jackson R. Allen was born December 31, 1869, in Draper, Utah, to Andrew Jackson Allen and Louisa Rogers. The senior Mr. Allen, a member of the LDS Church, had come to Utah in 1847 and was a stockman all his life. Jackson R. Allen graduated from the normal school of the University of Deseret In 1890. He taught, kept books, and worked in the County Recorder's office briefly before becoming a stockman. With his three brothers he operated the Allen Brothers Stock company. The Allen ranch, known as the Excelsior Stock Farm, operated at seven different sites, six in Draper. He was president for forty years of the East Jordan Canal Co., president of the Draper Irrigation Co., an early member of the National Holstein Associaiton, and a member of the Draper School Board. In 1891 he married Matilda C. Ray, by whom he had seven children. In 1936 he married Helena Gardner. A member of the LDS Church, he died in 1943. His elegant and exceptionally well-documented home reflects the aspirations and the means of a successful Utah stockman of 1900.

CONTINUATION SHEET

ITEM NUMBER 7 PAGE 2

ceiling was sheep wool, with apricot pits added as a scented preservative. Large, framed photographs of sheep were found by the present owners in the attic.

Interior woodwork was originally all hand-grained, except for the main stairway balustrade and sitting room fireplace. Woodwork motifs have Victorian Eclectic and Classical Revival overtones. Present owners have preserved original woodwork as much as possible, though damaged hand-grained areas were painted over. Dining room wainscotting is linerusta panels in a foliated motif. The present owners have recovered much of the home's original furniture through the Allen family. Some of these pieces were purchased in the east during Mr. Allen's travels.

The house has experienced several minor modifications on the interior. Early in the century it was electrified. Some brass light fixtures are intact. One of the downstairs bedrooms was converted into a kitchen when two of the Allen sibling's families jointly occupied the home though it now functions as a family sitting room. Kitchen and bathroom fixtues have been replaced in updating the home and two bathrooms have been added. However, the present owners have reversed much modifications made by previous owners and are concerned with maintaining the integrity of interior, as well as the exterior. Generally, original spaces have not been violated.

The site of the Allen home is the core of what was originally a large sheep ranch. In addition to the home, many outbuildings are extant, preserving the character of the ranch complex. A large barn predates the home, serving the ranch from its earliest days (see early photo). It is a frame, cross gabled structure with two wings and a concrete silo to the west. The ice house/root cellar (also visible in the early photograph) was probably built during the same period as the home. It is a single story frame structure of rectangular plan with gable roof. The root cellar is underneath the ice house and is entered through a smaller gable roofed appendage on the south. Gable roofed frame garages and storage sheds of configuration similar to the ice house and located behind it (to the north) were constructed at some later point. Chicken coops were located to the southeast of the house.
