NPS Form 10-900 Oct. 1990

United States Department of the Interior National Park Service

National Register of Historic Places Registration Form

OMB No. 10024-0018 RECEIVED 2280 MAY 2 1 2008 NAT. REGISTER OF HISTORIC PLACES NATIONAL PARK SERVICE

This form is for use in nominating or requesting determinations for individual properties and districts. See instructions in *How to Complete the National Register of Historic Places Registration Form* (National Register Bulletin 16A) Complete each item by marking "x" in the appropriate box or by entering the information requested. If an item does not apply to the property being documented, enter "N/A" for "not applicable." For functions, architectural classification, materials, and areas of significance, enter only categories and subcategories from the instructions. Place additional entries and narrative items on continuation sheets (NPS Form 10-9000a). Use a typewriter, word processor, or computer, to complete all items.

Bridge #222 Beaver vicinity, Barton County, Kansas

NARRATIVE DESCRIPTION

Summary

This limestone and concrete bridge is located on an east-west rural township road, NE 210 Road, just oneeighth mile east of NE 60 Avenue in northeast Barton County. The bridge spans a tributary of Beaver Creek and was completed in 1940 as a Works Projects Administration job. "WPA" is stamped in the north concrete curb and "1940" is stamped in the south concrete curb of the bridge. The bridge supports and foundation are made of native limestone, and the deck is made of concrete. Concrete bridge rails span the length of the bridge on each side. Pasture and crop land surround the bridge. Limestone beds can be seen on the ridges of the hills dotting the countryside.

Due to the dimensions of the bridge, repair and maintenance is the responsibility of the Barton County Road and Bridge Department. The bridge is also required to be inspected by the Kansas Department of Transportation (KDOT).

This bridge is very similar in design and dimension to two other nearby WPA bridges that are also being nominated to the National Register: Bridge #640 and Bridge #650. Bridge #222 is located at the same intersection as Bridge #640, while Bridge #650 is just one mile north.

Elaboration

The superstructure of the bridge is comprised of concrete beams and banisters. The bridge substructure – the wingwalls, foundation, and single central support – is made of cut limestone blocks and mortar. The limestone blocks have a rusticated face and many retain the tool markings from when they were quarried by skilled WPA construction workers. The deck of the bridge is 26 feet long and the bridge roadway is 24 feet wide. The bottom of the bridge deck sits five feet off the ground. There are 10 feet between each bridge support. The only features visible from the roadway are the concrete banisters that serve as guardrails and the "WPA" and "1940 stamps on either side. The limestone wingwalls are built into the roadside embankments and protect the structure from erosion during high water flows.

We do not know who specifically designed this bridge. We do know that then-Barton County Engineer Harry Hunsley, II, designed many of the county's bridges.

This bridge is showing some deterioration in the mortar joints, but there are no significant structural concerns. The bridge has remained in use for public vehicular traffic since its construction in 1940 to the present time. It is listed in the bridge inventory of Barton County. Routine repairs and maintenance have been made to the bridge to comply with KDOT bridge inspections.

STATEMENT OF SIGNIFICANCE

Summary

Bridge #222 is being nominated to the National Register of Historic Places under Criterion A for its construction under the supervision of the Works Projects Administration (WPA) and Criterion C for its architectural significance as a native limestone bridge. The bridge, unique with limestone abutments, crosses a tributary of Beaver Creek in northern Barton County, north of Beaver. The bridge's native limestone construction is typical of structures built in this area and is representative of the master stone builders and craftsmanship of bridge construction workers trained by the WPA. The bridge is being nominated as part of the New Deal-era Resources of Kansas MPS.

History

Beaver -area History

"During the summer of 1918, Mr. Piester was named as local sales agent for the sale of town lots for the present town of Beaver. During this summer, Mr. Piester assisted in the organization of a bank to be known as the Farmers National Bank, to be located in the future town of Beaver. The Board of Directors of the Farmers National Bank were also the owners of the Farmers State Bank at Redwing, including the building housing it. It was voted to move the building and business of the Bank of Redwing to a site eight miles north. The building was placed on a moving outfit and was placed in Block 10 of the new Town of Beaver, and opened for business on Monday, August 10, 1918. Thus, was born the Town of Beaver, Kansas."¹

New Deal-era Historic Context²

Through the Works Progress Administration (later reorganized as the Works Projects Administration), Kansas realized many new public building and recreational facilities. Between July 1, 1935 and June 1, 1939 the WPA either built or improved 619 buildings in the state. That figure includes 36 administrative buildings, 16 auditoriums, 45 barns and stables, 58 community buildings, 59 dormitories, three firehouses, 35 garages, 12 gymnasiums, two hospitals, three jails and reformatories, ten other institutional buildings, seven libraries, 142 schools, 52 stadiums, and 16 warehouses. In addition, there were 121 WPA recreational facilities, including 59 athletic fields, 91 parks, five fairgrounds, 92 playgrounds, 40

Bridge #222 Beaver vicinity, Barton County, Kansas

swimming and wading pools, 14 band shells, five outdoor theaters, and 140 golf courses, tennis courts, handball courts and horseshoe courts.³

In 1939, Clarence Nevins, the state WPA Administrator, commended the people of Kansas. He observed,

"Your attention is called to the fact that practically all of the projects in Kansas have been sponsored by your local governments, and we take this opportunity to commend the counties, the cities, boards of education and other local governmental units in the State for the high type of projects submitted to this agency..."

Nevins concluded by commenting that in June of 1939 there were roughly 30,000 Kansans on the WPA rolls. He observed that over 47 percent were employed on highway or road and street projects; seven percent on public buildings; nine percent on recreational buildings; five percent on utility projects; three percent on road conservation projects; and two percent on airport and airway projects.⁴

Bridge History Context

Although this bridge is not nominated under the "Masonry Arch Bridges of Kansas" MPS document, it offers important contextual information. As is noted in the MPS document, "Little historical information, such as the designer, builder, and date of construction, is available on many of small rural bridges. Often bridge plaques that may have contained historical information have been removed or the county's records are not complete."⁵

There is no record of who designed this particular bridge, but it is known that then-Barton County Engineer Harry Hunsley, II, was integrally involved in the planning and execution of this and other similar local bridge projects. Fortunately, this bridge retains its "WPA 1940" stamp on the cement curb of the bridge noting its construction as part of a WPA project. More than likely this same bridge design was used multiple times. This bridge is very similar in design and dimension to two other nearby WPA bridges that are also being nominated to the National Register: Bridge #640 and Bridge #650. Bridge #222 is located at the same intersection as Bridge #640, while Bridge #650 is just one mile north.

The "Masonry Arch Bridges of Kansas" MPS document also discusses the use of limestone arched bridges well before the New Deal programs of the 1930s. It suggested that the use of limestone was common because "the stone was often available locally. Thus, a larger amount of the money expended for the construction could be retained within the area than would be true with the purchase of a metal

structure. It was also often possible to use local workers on the project. This approach sometimes had its drawbacks as the quality of local stone and workers would vary widely."⁶

Construction Process

The current Barton County Engineer, Clark Rusco and Financial Officer, Janet Crane interviewed Harry Hunsley, III, about several area WPA bridges. The following excerpt on the construction process was compiled from this interview and Mr. Hunsley's personal notes:

During the late 1930s and early 1940s, the Works Projects Administration (WPA) began a massive public works program to provide living wages for the unemployed. A part of this program was the construction of hundreds of small drainage structures of native limestone in Kansas. The stone arch bridges built throughout North Central Kansas during the WPA era were generally built close to the quarry. Evidence of these old quarries can normally be found within a half mile of the structure location. The difficulty of transporting stone by man and animal made it mandatory that quarries be located near the job site. There is evidence of numerous abandoned quarries within a short distance of Beaver.

The limestone ledges would be stripped of overburden by use of mules/horses pulling a drag or "tumble bug"; the cleaned surface would then have a series of holes manually drilled at even spaces approximately 12" apart by use of a star drill. The holes would be carefully filled with water and allowed to freeze overnight. The freezing process would open a seam in the rock, and men would carefully break out the rock using pry bars specially made for this operation.

The stones were sometimes cut into proper sizes at the quarry and transported to the job site by wagons. Other times, the stone would be taken to the job site in long (8'-10') lengths which were carefully attached to the undercarriage of wagons by block and tackle accompanied by serious physical labor. It is a general assumption that the decision as to whether to take cut stones or long slabs depended on where the stone masons wanted to perform the finish operation of dressing the individual stones to fit the plans for the structure.

Most, but not all, of these structures were built as arches. Bridges employing only compression are relatively inefficient structurally, but may be highly cost efficient where suitable materials are available near the site and the cost of labor is low. For medium spans, trusses or box beams are usually most economical, while in some cases, the appearance of the bridge may be more important than its cost efficiency. This is very true of construction during the WPA era; the purpose was to create jobs for the unemployed, not the practicality of the project.

Summary

Author Henry Tyrrell said in his book *Artistic Bridge Design* that "the bridges and structures created by a people or nation reveal their degree of aesthetic taste and are a measure of their culture and civilization.

National Register of Historic Places Continuation Sheet

Section Number <u>8</u> Page <u>5</u>

Bridge #222 Beaver vicinity, Barton County, Kansas

Bridges should be strong enough to last and beautiful enough to be worth preserving."⁷ This bridge clearly reflects the use of local materials and craftsmanship that is worthy of preservation. The bridge remains a part of the public transportation system for Barton County and is used by typical rural traffic. It is routinely inspected and, with rehabilitation, should retain its structural integrity and be preserved as an example of local stone arch bridge building skill.

Barton County is the lead governmental agency for the Kansas Wetlands and Wildlife National Scenic Byway. There is an increased historic awareness of the architectural significance of projects built under the WPA. We realize that tourists and travelers enjoy the cultural and historic aspects of local communities. Developing a listing of historic WPA bridges will enhance the travelers' experience of our local region.

Our local citizens want to protect our historic resources to preserve our own cultural heritage for generations to come. Most importantly, the bridge is beautiful and aesthetically charming in the rural countryside setting.

⁷ As quoted in "Masonry Arch Bridges of Kansas" MPS, p 8-3.
