DESCRIBE THE PRESENT AND ORIGINAL (IF KNOWN) PHYSICAL APPEARANCE

The Citizen's and Southern Bank Building at the intersection of Broad and Marietta Streets was originally constructed in the commercial style and later in its history, the lower floors of the building were remodelled in the Second Renaissance Revival style. In its initial form, however, the facades of the building were straight, the roof was flat and the skyline level. "The fenestration pattern was one of regularly spaced paired windows with the glass area large in proportion to the area of masonry. The piers and spandrels were in the same general plane with a fairly even balance between vertical and horizontal elements of the facade. The facade was terminated by a cornice of moderate projection." The base of the original building consisted of the three lower floors of the building and had large, squarish openings of glass separated by strongly expressed piers. The eleven floors above the base constituted the shaft of the original building and were clad in tan or warm buff brick. The windows were grouped in pairs over simple spandrel panels. The top three floors of the building were treated slightly differently from the typical shaft floors. "At the sill line of the top(14th) floor and the 12th floor rather flat minor cornice treatments occur. At the sill line on the 13th floor the sill is extended horizontally across the pier in a treatment which is not typical of the other shaft floors. The main cornice which tops the facade is relatively flat and unassuming. The cornice is peculiar in that at the corners the lower members of the cornice do not carry around the corner. Instead, they return on themselves creating a rather strange open corner."

In the late 1920's the architectural firm of Hentz, Adler and Schutze redesigned the three-story base of the building in the Second Renaissance Revival Style. At that time the stucco which had previously been used as a facing material and the cast iron used for classical ornament and detailing was abandoned in favor of stone.

In the new scheme, the three lower floors of the bank became more solid than void with only a small number of openings penetrating the skin of the building. "The first openings in the corners of the lower two floors occur well away from the corners. Stone niches occur on all three street facades in the corner bays. On the longer (Broad Street) facade which contains the entrance to the building lobby a rhythm of niche, tall arched opening, three large rectangular windows, three tall arched openings, three large rectangular windows, tall arched openings, niche form the pattern of the two lower floors. At the third floors level, and separated from the lower portion of the base by a horizontal stone band course, are large rectangular windows which are centered above the arches and windows which occur in the lower floors.

In the traditional manner of the Renaissance, all of the openings and corners of the base of the building have rusticated stone trim. "The arched openings which contain windows have a window with heavily moulded trim and a pediment in the lower part of the opening. Above the spring line of the arch is a window filling the arch and being subdivided by vertical mullions into three segments." The three arches which contain entrances --- on the Marietta, Broad and Walton Street sides --- extend down to the sidewalk level rather than stopping at a shoulder high base as is the case with those arches containing windows. On the Marietta Street facade can be found one entrance arch leading to the banking room and flanking arches to the side contain windows; the entrance is in the arch farthest away from Broad Street. The Walton Street facade also has one entrance arch leading to the banking room and one window arch with the two being separated by typical rectangular windows. The main building entrance on Broad Street provides one of the more unusual features of the design of the base. "The entrance occurs in the right (southern) arch of the central group of three arches and not as might be expected, in the center arch."

CONTINUATION SHEET Description

ITEM NUMBER 7 PAGE 2

On the interior, the main banking room extends the length of the block from Walton Street to Marietta Street and is a full two stories in height. With walls finished in warm, Italian marble and contrasting white marble trim, dark Corinthian pilasters support a cornice which runs entirely around the room. The pilasters also help to divide the walls into panels which contain shallow arched niches below rectangular recessed panels on the wall behind the banking counter. On the opposite wall the arches are functional in providing access between the banking hall and the offices of the bank's officers; rectangular openings can be found over the arches on this wall that give visual access to the executive spaces at the second floor level. The floor of the banking hall is noteworthy for its marble pattern in large alternating circles and squares in four colors. The large circular bronze chandeliers down the center of the room are all consistent in scale and design treatment with the room's other architectural features.

SPECIFIC DATES 1901/1929

BUILDER/ARCHITECT

Morgan and Dillon, 1901
Hentz, Adler and Schutze, 1929

STATEMENT OF SIGNIFICANCE

The Citizens and Southern Bank Building , built in 1901 and remodelled in 1929, is significant architecturally as a work of two leading Atlanta firms, Morgan and Dillon (1901) and Hentz, Adler and Schutze (1929). As originally planned and built during the years 1901-1902, the Citizen's and Southern Bank Building, then known as the Empire Building, exhibited characteristics usually associated with the Chicago School: " Unity between structure and design is achieved through the interpenetration of vertical piers with horizontal spandrels expressive of the steel cage construction. Ornament, used sparingly in base and upper two stories and around entrances, does not interfere with this unity. Horizontally elongated windows, characteristics of the Chicago School, provide a maximum glass area." The design of this building "reflected the influence of Morgan's trip to Chicago and New York," which the architect had made only a short time before beginning this project.

Between the years 1919 and 1929 the Empire Building was known as the Atlanta Trust Building, and in 1929 became the Citizen's and Southern Bank after being purchased by that organization. The well-known Atlanta architectural office of Hentz, Adler and Schutze were engaged to remodel the lower floors of the building only a short time after the building was acquired in December, 1929. The design, which features an Italian Renaissance-inspired three-story base and on the interior a large, two-story banking hall, was "inspired by the Pantheon in Rome, Italy" according to one report. "Liberally floored and wainscoted in marble" the banking portion is as luxurious as any bank would ever hope for and stands even to this day as not only a monument to the banking profession but a monument to the Atlanta architectural firms that created it.

As a product of two periods of Atlanta's growth, the Citizen's and Southern Bank Building represents in its architectural form characteristic attitudes of Atlanta's business community. These men in the boom period of the turn of the century when Atlanta rapidly took on the appearance of a metropolis through a cluster of tall buildings, proud proclaimed Atlanta the New York of the South. Embracing the new technology of steel frame skeleton construction, they built the office building center of the New South. At the same time in tune with national trends, they cloaked the progressive construction of their business buildings in monumental, classically detailed facades. During the twenties, this design approach was dominant and continued to express the affluence and success of the city's commercial growth. The Renaissance banking hall, actually an intrusion in the fabric of an interesting Commercial Style building, is yet, because of the skill of its architect, one of the grandest and well-designed spaces in central Atlanta.
