DESCRIBE THE PI	RESENT AND ORI	GINAL (if kno	wn) PHYSICA	L APPEARANCE				

The Jamestown Windmill, built in 1787, stands on high land on Conanicut Island, overlooking the East Passage of Narragansett Bay. Massively constructed of hand-hewn oak timbers diagonally braced, and placed on a rubble foundation, it is shingled on the outside. The corners are sheathed with vertical strips. In shape the mill is a three-story octagonal tower about 30 feet in height with a domed top or bonnet whose interior framing is umbrella-like. This bonnet carries the windshaft which holds the latticed wooden arms, or sweeps, and it is designed to turn on an iron track (the original track was of wood) so that the 25-foot vanes may be faced into the winds. V(In earlier mills, the building rested on a post or pivot, and the whole structure was turned to face the wind.) A simple plank door with strap hinges opens at the south into the first floor, which is 20 feet wide. There is also a "back" door. The two granite grinding stones, $5\frac{1}{2}$ feet in diameter, are in position under the driveshaft. A lever raises the upper stone by about $\frac{1}{4}$ inch for grinding, when the corn is poured between them through a trap-door and chute from the second floor. A crane device can lift the top stone away, when this is required, to be roughened by a set of sharp rods. The walls have exposed interior corner posts, studs, cross-braces, and sheathing. (Much of the wood, including elements of the extremely heavy grinding table, is a part of skillful restoration.)

Narrow stairs lead up to the second story, which provided storage for both corn and meal. The third floor is filled by the huge wheel that surrounds the windshaft. This wheel transmits the motion of the outdoor arms to the main shaft, a heavy, vertical post connected to the top grinding stone. The old wooden gears have been replaced with iron ones, and much of the wheel bracing has been rebuilt. The bonnet itself, which turns on a gear track connected to a large sprocketed wheel outside turned by pulling a continuous chain, has been repaired and reshingled. Here, as in each of the three floors, tiny windows admit only enough light to see; the large wheel is a striking sight even in the semi-darkness. A frame of delicate arched wooden ribs supports the bonnet.

The windmill remained in use by the community until 1896. Restoration of the exterior was undertaken in 1957, and in 1960 restoration and repair of the mechanical and grinding works inside the building made them operable again. \heartsuit

STATEMENT OF SIGNIFICANCE

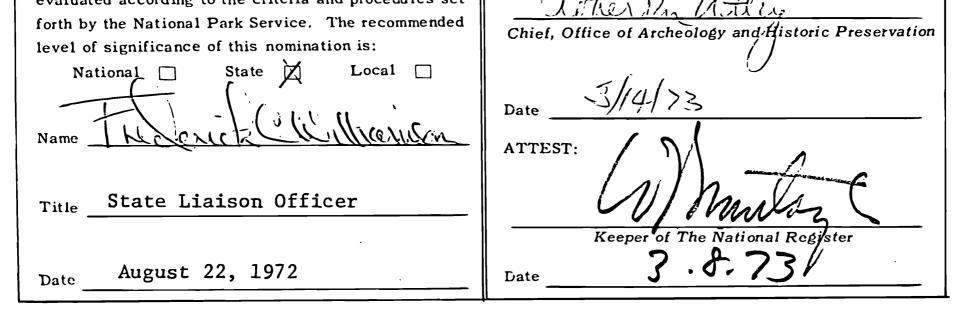

Windmills of this type, once common and basic necessities, are now fast-disappearing, interesting examples of former ways of grinding grain. Belived to be the third windmill on Jamestown Island, this structure has stood (with the exception of repair and replacement when necessary) unchanged since 1787. It was then built with town appropriations, and later it came into the comperative ownership of fourteen individual, local millers who used it. It is a good example of early civic endeavor to provide a public facility or utility, and it is a fine example also of early utilitarian architecture and early mechanical contrivance.

The mill remained in continual operation until 1896. Since that time it has been under the care, first, of the Windmill Society which in 1904 bought it to preserve it and--soon afterwards and since--of the Jamestown Historical Society. The windmill has been restored to operating condition largely through locally-gathered funds. Although the windshaft and vanes had to be replaced after severe hurricane damage, the millstones, gears, crane etc. are all original, as are most of the structure's timbers.

A picturesque landmark at all times, the building is open to the public during the summer season, giving opportunity to inspect the machanism and operation of an early gristmill and the fine internal construction of this particular one.
