The Bedell Covered Bridge crosses the Connecticut River between Haverhill, New Hampshire and South Newbury, Vermont. The low water line on the west (Vermont) side of the river marks the boundary between the states. Most of the bridge, therefore, stands in New Hampshire; only the west end is in Vermont. Despite its interstate location, the entire bridge now belongs to the State of New Hampshire.

Present Physical Appearance

The Bedell Bridge consists of two spans, each of which is supported by two flanking timber Burr arch trusses. The trusses incorporate iron reinforcing rods which connect the top and bottom chords parallel to the wood diagonal braces. Iron tension rods connect the bottom chords to increase the lateral rigidity of the structure.

Each truss of the bridge has an original single-timber arch which extends the length of one span. The individual members of each arch were sawn and hewn to the required curvature; they are butted together between, and bolted through, the upright members of the truss. An auxiliary laminated plank arch, comprised of fourteen layers bolted together, has been added to each truss of each span for reinforcement. The laminated arches support iron suspension rods which, in turn, support wood beams placed beneath, and transverse to, the bottom chords.

The trusses and auxiliary arches have been allowed to deteriorate severely, endangering the integrity of the structure. Near the central pier, the north truss of the east span has broken upper and lower chords and partly collapsed upright members. Various members of the other trusses are also broken or displaced. The auxiliary arches are rotted at the points of entering the abutments and pier. Owing to the broken chords, the east span has negative camber of about thirty inches near the central pier; the west span also has considerable negative camber.

The structure rests on abutments built of irregular stone blocks laid dry. The central pier is built of irregular stone blocks which have been mortared together. On its upstream (north) side, the pier flares outward toward the river bed to deflect floating debris and ice. A concrete footing has been poured under the east abutment, which had been undermined and had begun to settle.

The Bedell Bridge has an overall length of 382 feet at floor level, divided into two equal spans of 191 feet each. The upper ends of the side walls flare outward to meet the gable ends, which overhang the floor five feet at each portal. The bridge is 23 feet wide overall and has an 18.5-foot original roadway, now reduced by the width of the auxiliary arches.

the towns transferred ownership of the bridge to the State of New Hampshire.

After completion in 1976 of the rehabilitation currently underway, the Bedell Bridge will probably remain closed to through vehicular traffic. A tentative plan for future use would have the bridge become the focus of a New Hampshire state recreational and historic park.
