

PETRIFIED SEA GARDENS  
View of Site  
Joane Kleussendorf, 1998

A black and white photograph showing a dense field of petrified stromatolites. The structures are characterized by concentric, circular or oval patterns, resembling tree rings or coral growth. The patterns are light-colored against a darker, more textured background. There are some dark, irregular shapes scattered throughout, possibly representing cracks or other geological features. The overall appearance is that of a fossilized, ancient sea garden.
