Supporting STATEMENT OF SIGNIFICANCE

Washington Monument:

Henry Washington was reportedly a nephew of George. He is considered one of the best of the early surveyors in California.

The reason for the multiple points is that Washington (with equipment and methods available) did not consider it feasible to run north or south from the initial point. Instead, he went through a series of "stair-step" offsets, returning to the meridian position some distance north of the baseline. It appears that errors developed from this procedure. When Rice, in later years, projected the meridian south to close the gap, he intersected the baseline at a different location than Washington's point.

The Pearson Monument is a closing corner which is the normal result of closing on a standard parallel or baseline from the south. According to accounts published in "Surveying and Mapping," this fact seemed to confuse the party who investigated the scene in 1966. For some strange reason, they did not consult with the BLM in advance of their expedition.

The report published by the Museum Society indicates that Washington's Monument is a few feet off of the baseline. This is not true; his monument is a <u>point on the baseline</u>. Therefore, it is and always has been a part of the U.S. Public Land Survey.
