DESCRIBE THE PRESENT AND ORIGINAL (IF KNOWN) PHYSICAL APPEARANCE

The Decorah Ice Cave is located at the base of a limestone cliff about a hundred yards north of the Upper Iowa River in a wild and natural area which is a part of the Decorah Park System. The cave is a system of crevices about 200 feet long and 15 feet deep, apparently formed by slumping of the Galena limestone on the underlying Decorah shale, probably aided by ice wedging during glacial periods.

The cave is dry during fall and early winter. Ice first forms near the entrance in January or February and then at lower and lower levels until it reaches the lowest chamber where maximum accumulation of ice occurs late in May with a thickness of several inches on the north wall. Ice often remains on this wall until late August.

The cave and the area surrounding it are probably in almost the same condition as when first seen by white men, except for the addition of rock steps constructed near the entrance about 1930, and a few footpaths.

The Ice Coye lies inside an area of 2.9 acres which has been dedicated as an Iowa State Preserve. The area includes a number of other caves and crevices. It also is one of the best exposures in the area for viewing the contact between the Galena limestone and the Decorah shale. The lowest 85 feet of Galena strata are well exposed at this location and easily accessible for close observation.

The Ice Cave Preserve is surrounded on all sides by City Park property which is in a wild and natural state. An unpaved road maintained by the county runs east-west along the south edge of the preserve.

STATEMENT OF SIGNIFICANCE

Nomination of this site will appropriately recognize scientific investigations that led to the prevailing theory of ice cave formation by Alois Kovarik in 1898. The Ice Cave at Decorah was a fitting subject for the research because, unlike most caves, ice usually forms within the cave in the Spring and attains a thickness of 8-10 inches by early summer before disappearing in September. The history of early scientific research at the cave has been summarized by George E. Knudson and James Hedges (1973). They state in part:

The Ice cave at Decorah, Iowa, is the largest known glaciere in North America east of the Black Hills and the subject of much international speculation during the latter half of the nineteenth century.

In 1860, only 12 years after the first white settlers arrived in the area, a note was published in the Scientific American commenting on the unusual behavior of the cave. Over the next 40 years a long series of articles in this and other scientific publications speculated on the possible mechanisms of ice formation and brought international recognition to the cave. The series culminated in an article in 1898 in the Scientific American Supplement by Alois Kovarik, who proposed a mechanism which was accepted by the leading authorities of the day and which still seems to be the most reasonable explanation of the phenomenon.

Over a three-year period, 1897-99, Alois Kovarik made frequent observations at the cave, collected meteorological information and published the data in articles... He explained that cold air circulates freely through the cave in winter, cooling the rocks to a temperature below the freezing point of water. The warmed air ascends out of the cave through fissures in the roof. Moisture in the air produces a coating of hoarfrost in some locations but production of thick layers of ice must await the arrival of water following a thawing of the bluff surface above. Since the nouth of the cave is higher than the ice chamber, cold air is trapped in the interior in the summer, there is little circulation to bring in heat, and ice is able to persist until August or September.

Kovarik, who was born is Spillville, about twelve miles from Decorah, was an 18-year-old instructor in the Decorah Institute when he made his observations and published his first scientific paper. His reports on the Ice Cave were the first of a long series of scientific publications, as he went on to...achieve international recognition as a nuclear physicist while a professor at Yale University.

VERBAL BOUNDARY DESCRIPTION

Property is located in the NW4 of the NW4 Sec. 15-98-8. The preserve boundary begins 210 feet east of the western edge of this quarter-quarter section, and runs 150 feet north from the north side of Cave Road, then 560 feet east, then 300 feet south to Cave Road. The southern boundary of the preserve is Cave Road.
