National Register of Historic Places Registration Form  

1. Name of Property  

Historic name: N/A  
Other name/site number: North Fork Solomon River Lattice Truss Bridge (preferred); 69-LT-21; 000690533503541  

2. Location  

On Road W7, 0.1 miles south of the intersection with Road BB (aka 15 S); 1.5 miles west of the town of Lenora.  

City or town: Lenora  
State code: KS  
County: Norton  
County code: 137  
Zip code: 67645  

3. State/Federal Agency Certification  

As the designated authority under the National Historic Preservation Act of 1986, as amended, I hereby certify that this application request for determination of eligibility meets the documentation standards for registering properties in the National Register of Historic Places and meets the procedural and professional requirements set forth in 36 CFR Part 60. In my opinion, the property ___meets___ does not meet the National Register criteria. I recommend that this property be considered significant nationally, statewide, locally. (See continuation sheet for additional comments.)  

Signature of certifying official: [Signature]  
Date: [3/6/03]  

State or Federal agency and bureau  
In my opinion, the property ___meets___ does not meet the National Register criteria. (___ See continuation sheet for additional comments.)  

Signature of commenting or other official: [Signature]  
Date: [ ]  

State or Federal agency and bureau  

4. National Park Service Certification  

I, hereby certify that this property is ___ entered in the National Register. See continuation sheet. ___ determined eligible for the National Register. See continuation sheet. ___ determined not eligible for the National Register. See continuation sheet. ___ removed from the National Register. ___ other, (explain:)

8. Statement of Significance

Applicable National Register Criteria (Mark "x" in one or more boxes for the criteria qualifying the property for National Register listing.)

___ A Property is associated with events that have made a significant contribution to the broad patterns of our history.

___ B Property is associated with the lives of persons significant in our past.

X C Property embodies the distinctive characteristics of a type, period, or method of construction or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components lack individual distinction.

___ D Property has yielded, or is likely to yield, information important in prehistory or history.

Criteria Considerations (Mark "x" in all the boxes that apply.)

___ A owned by a religious institution or used for religious purposes.

___ B removed from its original location.

___ C a birthplace or a grave.

___ D a cemetery.

___ E a reconstructed building, object, or structure.

___ F a commemorative property.

___ G less than 50 years of age or achieved significance within the past 50 years.

Areas of Significance

city or town: Norton
state: KS
zip code: 67654

telephone: 785-877-5740
DESCRIPTION
LOCATION AND SETTING
The North Fork Solomon River Lattice Truss Bridge is located 1.5 miles west and 0.1 miles south of the town of Lenora in north central Kansas, on the line between the NE ¼ and the NW ¼ of Section 21, Township 5S, Range 24W. The region is defined by rolling prairie hills with tree-lined creeks. The North Fork Solomon River Lattice Truss Bridge carries Road W7 across the North Fork of the Solomon River, a shallow, meandering branch that flows east to join the South Fork in Waconda Lake. The dirt roadway, flanked by cultivated fields, aligns directly with the North Fork Solomon River Lattice Truss Bridge.

TRUSS TYPE
The North Fork Solomon River Lattice Truss Bridge is a single span, riveted pony truss that measures 40 feet in length and 16 feet in width. Historic, standard, box-form poured concrete abutments support the end floor beams of the truss, which rest directly on the abutment seat. The side walls of the abutments extend approximately 15 feet along the approach grade. Metal sheet and piles form the north abutment’s east side wall.

The short end posts and top chord curve into one another to form the distinctive, wide and shallow “basket handle” shape of this bridge type; two angles with cover plates form the top chord and end posts. The web members include a system of thin crosshatched diagonal lacing bars. Two, heavy, parallel angle bars extend diagonally down from each of the upper end nodes and meet at a centered, angle buttress post to help support the single, central floor beam. Lower lateral bracing rods connect the central floor beam with the end floor beams. The timber deck is 16 feet wide and rises 12 feet above the creek bed on steel I-beam stringers. Approximately 18 inches of dirt covers the decking.

Distinctive cast iron florets decorate each of the central intersections of the diagonal lacing bars. A series of numbers, “15319 081,” are repeatedly stamped into the cover plate of the top chord. The central floor beam is stamped “J & L.”

INTEGRITY
The North Fork Solomon River Lattice Truss Bridge is an excellent example of this bridge type, which is increasingly rare in Kansas. The non-historic repair of the north abutment side wall and the heavy accumulation of dirt obscuring the decking do not significantly impact the overall integrity of the bridge. The North Fork Solomon River Lattice Truss Bridge retains a good degree of integrity, with no significant alterations to the original design or materials. In addition, the original workmanship, setting, and feeling of the structure are readily apparent. Furthermore, the potential for preservation of the bridge is high. Located on a lightly traveled road, it is unlikely that traffic requirements will necessitate alteration or replacement.

1 A pony truss is also referred to as a low truss.
2 The length equals the distance between the abutments; the width equals the deck width.
3 Likely shorthand for Jones & Laughlins Steel Corporation, Pittsburgh, Pennsylvania.

STATEMENT OF SIGNIFICANCE
The North Fork Solomon River Lattice Truss Bridge is significant under National Register Criterion C in the areas of Engineering and Transportation. As defined by the *Multiple Property Documentation Form for Metal Truss Bridges in Kansas*, it is an excellent example of the Lattice truss bridge type. Built in 1925,¹ the North Fork Solomon River Lattice Truss Bridge is a rare example of a relatively uncommon bridge solution for a short span. Its riveted structure and concrete abutments illustrate the standardization of these construction techniques and materials during the period of significance. As no historic name identifies this bridge, the preferred name “North Fork Solomon River Lattice Truss Bridge” has been assigned. This describes and identifies the location, design, and function of the structure.

ELABORATION
The need for all-weather crossings of rivers and streams corresponded to the growth of the market economy across Kansas during the late nineteenth and early twentieth centuries. Bridges provided farmers easy access to markets and could make the difference between growth and stagnation for the many small, young communities across the state.² Proximity to a bridge often secured a town’s economic stability, and it contributed to a local sense of modernity.

Prior to the 1930s, the railroad was the primary means of long-distance travel and there was little need for roads to extend more than a few dozen miles. With little stimulus for improving roads that would cross multiple jurisdictions, road construction and maintenance remained local concerns. County commissioners often carried the burden of selecting bridge locations, over which much contention was common.

The range of choices for bridge designs and companies was vast. Many of the larger bridge companies sold metal truss bridges through mail order catalogues. County commissioners could simply specify the span, clearance needs, and truss type (if there was a preference), then choose the lowest bidder from the numerous competing companies that had salesmen in the field.

By the late nineteenth century, fabrication of iron and steel was widespread. The speed of construction and the relatively low cost of metal truss bridge parts ensured their popularity over labor-intensive masonry bridges and short-lived timber bridges. Toward the end of the nineteenth century the quality, quantity, and cost of steel improved to such a degree that it virtually replaced wrought iron for bridge construction by 1910.³

Most metal trusses were constructed of built-up members composed of mass-produced, standard-shaped channel, plate, and angle stock purchased from one or more of the numerous steel companies nationwide. The bridge companies preassembled trusses in their factories then simply shipped them to the bridge site for installation. Installation involved grading approaches, constructing abutments and piers, erecting preassembled floor and truss members, and placing deck material.

¹ Norton County Road and Bridge records, Norton, Kansas.
² Larry Jochims, *Metal Truss Bridges in Kansas 1861-1939, National Register of Historic Places Multiple Property Documentation Form*, (Topeka: Kansas State Historical Society, 1989), E.
³ Ibid, F.
Before 1900, generally all panel point connections – the locations at which structural bridge elements intersect – were made with the use of a pin. This technique was so widespread that it became one of the distinctive features of American bridge construction in the nineteenth century. However, subsequent advancements in pneumatic riveting techniques greatly improved rivet installation quality, enabling more reliable panel point connections. With the increased portability of this construction technology, the more rigid riveting technique rapidly surpassed pin-connected bridge construction during the first years of the twentieth century. The riveted construction of the North Fork Solomon River Lattice Truss Bridge illustrates the standardization of this technique.

In addition, the contemporary development of economic cement production promoted the widespread combination of steel and concrete in bridge construction. It was not uncommon for older metal truss bridges to receive new reinforced concrete decks or poured concrete reinforcements for older stone abutments. By the 1920s, reinforced concrete was the standard material for abutments, piers, and decks of steel truss bridges. The poured concrete abutments of the North Fork Solomon River Lattice Truss Bridge are typical of bridges built during this period.

The North Fork Solomon River Lattice Truss Bridge is a classic example of this truss design. The lattice truss is derived from a design patented by Ithiel Town in 1820. This design was originally intended for wooden truss bridges and consisted of closely spaced diagonal timbers that created a stiff web of great strength. A variation of this design, patented as the Howe Truss in 1840, employed a combination of both wood and wrought iron members. By the late nineteenth century, wood members were abandoned and the Lattice truss design was executed using the cheap, standardized iron and/or steel parts being mass-produced at the time.

In Kansas, communities primarily in the north-central and northwestern regions of the state continued to construct lattice truss bridges into the early part of the twentieth century. In 1998, only three lattice truss bridges, including the North Fork Solomon River Lattice Truss Bridge, existed throughout the state of Kansas.

STRUCTURE HISTORY
First settled in 1873, the nearby town of Lenora was the thriving western terminus of the Central Branch of the Union Pacific Railroad. Named in honor of Mrs. Lenora Hauser, the town featured both a post office and a store by 1875. Lenora had only 125 residents in 1880, but as a regional trading center supported three general merchandise stores, three physicians, two hotels, two mills, two shoemakers, two livery stables, a barber shop, a billiard hall, a lumberyard, a meat market, a restaurant, a blacksmith, a hardware store, a drug store, a wagon

4 Ibid.
5 T. Allan Comp and Donald Jackson, Bridge Truss Types: A guide to dating and identifying. (Nashville, Tennessee: American Association for State and Local History, Technical Leaflet 95), 3.
6 Jochims, El. Of the 10 identified by Jochims as extant in 1989, eight were located in Norton County, including the North Fork Solomon River Lattice Truss Bridge, and one in neighboring Phillips County.
7 Nimz, 6. Of the three Lattice truss bridges identified by Nimz as extant in 1998, two are standing in Norton County, including the North Fork Solomon River Lattice Truss Bridge and the West Sappa Creek Lattice Bridge, which is listed in the National Register. Six additional lattice trusses, which have been replaced since 1989, are currently in storage with the Norton County Engineer.
maker, a lawyer, a flour store, and a newspaper office. Typical of small towns throughout Kansas, it served as a trading and shipping point for the surrounding rural community. As a result, fords and bridges that provided area farmers with access to local markets were critical to the survival of the regional economy.

According to Norton County Road and Bridge records, the North Fork Solomon River Lattice Truss Bridge was constructed in 1925. No further construction history has been located at this time. However, identical Lattice truss bridges located in Norton County, including the West Sappa Creek Lattice Bridge, retain cast-iron identification plaques that read “THE CANTON / BRIDGE CO. / CANTON, OHIO,” suggesting the strong likelihood that the North Fork Solomon River Lattice Truss Bridge is a product of the same builder. Markings on the structural members indicate that the Jones & Laughlin Steel Corporation of Pittsburgh, Pennsylvania, produced the stock metal. A prolific out-of-state bridge builder in Kansas, the Canton Bridge Company heavily marketed short span truss bridges, including the Lattice design, in this region at the turn of the century.

The Canton Bridge Company of Canton, Ohio advertised in Engineering Record as early as 1876 and was incorporated in 1891. The executives in 1891 included W. E. Sherlock, President; V. H. Hammond, Vice President; and C. E. Timkler, Chief Engineer. Massillion Steel Joist Company of Massillion, Ohio purchased the company in 1925 and the two companies were merged into Macomber Steel Company in 1927.

---

9 Inquiry into the Norton County Road and Bridge records, Kansas Department of Transportation records, Kansas State Historical Society archives, Norton County Historical Society archives, and Western Contractor revealed no further construction history specific to the North Fork Solomon River Lattice Truss Bridge.
10 This bridge was listed on the National Register of Historic Places in 1989. Six identical Lattice truss bridges are in storage with the Norton County Engineer.
11 Larry Jochims, West Sappa Creek Lattice National Register of Historic Places Registration Form, (Topeka: Kansas State Historical Society, 1989).
12 Ibid.
13 Ibid. It is likely that V. H. Hammond is a relation of D. Hammond of Wrought Iron Bridge Company in Canton, Ohio.

GEOGRAPHICAL DATA

Verbal Boundary Description:
Located on the line between the NE ¼ and the NW ¼ of Section 21, Township 5S, Range 24W, the North Fork Solomon River Lattice Truss Bridge encompasses an area measuring approximately 40 feet by 16 feet. The northwest corner of this area corresponds to the northwest corner of the bridge.

Boundary Justification:
The boundary includes the truss, deck, abutments, and associated approaches that represent the significant features associated with the bridge structure.

National Register of Historic Places
Registration Form

This form is for use in nominating or requesting determinations for individual properties and districts. See instructions in How to Complete the National Register of Historic Places Registration Form (National Register Bulletin 16A). Complete each item by marking "x" in the appropriate box or by entering the information requested. If an item does not apply to the property being documented, enter "N/A" for "not applicable." For functions, architectural classification, materials, and areas of significance, enter only categories and subcategories from the instructions. Place additional entries and narrative items on continuation sheets (NPS Form 10-9000a). Use a typewriter, word processor, or computer, to complete all items.

North Fork Solomon River Lattice Truss Bridge
Norton Co., Kansas

RELOCATION APPROVAL

Norton County is requesting approval to move the North Fork Solomon River Lattice Truss Bridge (NR listed 05/09/2003) from its current location on Road W7 1.5 miles west and 0.1 miles south of the town of Lenora. Built in 1925, the Lattice truss bridge measuring 40 feet in length and 16 feet in width is too narrow with insufficient load limit capacity for current traffic requirements. Unless the bridge is replaced, the road will be closed to through traffic.

Relocation Plan

The North Fork Solomon River Lattice Truss Bridge is being moved because it is too narrow and the load limits too low for current traffic needs along Road W7. The road will need to be closed to through traffic as the existing bridge cannot sustain the vehicles that currently travel this county road. Norton County owns the bridge and oversees the maintenance of Road W7, and is committed to saving the bridge from demolition by relocating it. The decision to move (rather than demolish) the bridge came, in part, because the bridge is intact and in good condition. The loss of integrity will be almost exclusively to the environs. While efforts are being made to site the bridge nearby and orient it in a similar environment, it will lose its original surroundings.

The county proposes to move the bridge to cover a tributary of the Prairie Dog Creek located on the Prairie Dog Golf Course, a public course just south of Norton, Kansas. The bridge would replace a current 20-foot structure that is used for foot and golf cart traffic.

Tom Brannon, Norton County Road and Bridge Supervisor, will be overseeing the bridge relocation. The dirt roadway will be cleared from the bridge to reveal the wooden decking. The wooden decking will be removed to reveal the iron and steel bridge structure. The structure will be loosened from the roadway footings using tools and chisels, but will remain intact as a single piece. A crane will then remove the structure from the roadway footings and place it on a flatbed truck for transportation to its new location. The iron and steel structure will then be lifted into place by the crane on its new base and secured with concrete foundation pads. The wooden deck will be reused where possible and any replacement pieces will be fitted to match the existing decking. Efforts will be taken throughout the project to minimize damage and preserve the materials.

The Prairie Dog Golf Course staff will be responsible for landscaping the area around the bridge to provide an attractive setting. A Canton Bridge Company bridge plaque has been found in the county archives. As this was the same bridge company that built it, this plaque will be placed at the bridge’s south banister to further document its historical significance.

North Fork Solomon River Lattice Truss Bridge  
Norton Co., Kansas  

CRITERIA CONSIDERATION B

The proposed relocation of the North Fork Solomon River Lattice Truss Bridge will not affect the integrity or the significance of the structure, which was nominated under Criterion C for its engineering significance as “a rare example of a relatively uncommon bridge solution for a short span.” In its new location, the North Fork Solomon River Lattice Truss Bridge will be preserved and open to view by the public.

ARCHEOLOGICAL REVIEW OF PROPOSED NEW SITE

The Kansas State Historic Preservation Office has reviewed its cultural resources files for the area proposed for relocation of the North Fork Solomon River Lattice Truss Bridge in accordance with 36 CFR 800. The proposed new location will cross a tributary of Prairie Dog Creek located on the Priarie Dog Golf Course. The proposed new bridge location along an existing railroad grade possesses low potential for archeological sites. The proposed bridge location project should therefore have no effect on properties listed in the National Register of Historic Places or otherwise identified in our files. This office has no objection to the implementation of the project.
