DESCRIBE THE PRESENT AND ORIGINAL (IF KNOWN) PHYSICAL APPEARANCE

Lover's Leap Bridge is a wrought-iron through lenticular truss bridge prefabricated by the Berlin Iron Bridge Company, East Berlin, Connecticut, and erected in 1895. It carries Pumpkin Hill Road over the Housatonic River, about 60' above the deep, wooded gorge from which the bridge received its name. The roadway is 19' wide and the single span is 173' long between the abutments, which are constructed of rough stone laid as coursed ashlar.

The bridge design, patented by William Douglas and Charles Jarvis in 1885, consists of arch, truss and suspension elements. The end columns and arch which rests upon them are box girders with one latticed side. From the same points where the arch rests upon the columns is hung a suspension chain with ten links of two parallel eye-bars. The upper and lower chords are formed into a truss by nine vertical lattice girders at each link. The deck is suspended from the lower chord with a composite eye-bar and lattice girder. As was the American practice, the bridge is pinned, not rivetted, together. The two sides of the bridge are tied together with lattice girders between the arches and between three of the truss uprights. Diagonals tying both the trusses and the two sides of the bridge are tie-rods with turnbuckles.

The roadway is laid upon corrugated iron sheets carried on I-beams paralleling the direction of the bridge. These in turn rest on the I-beam cross members suspended from the truss. Diagonal tie-rods connect the cross-beams.

The bridge is not without ornamental effects. Urn finials surmount the end columns. The lattice girder between them is shaped so as to form an oval portal, and the top edge gently slopes upward to a point where the builder's plate is attached. On either side of the plate is a cresting of delicate ironwork, in a fleur-de-lis motif. The guardrail, which runs the length of the bridge on both sides, has three tiers, the middle with uprights and the top and bottom with diagonals as well, with rosettes where they cross. There are only remnants of a tubular iron approach quardrail.

STATEMENT OF SIGNIFICANCE

Lover's Leap Bridge is important because it is an iron bridge and because its fabricator, the Berlin Iron Bridge Company, in many ways represents the epitome of iron bridge-building. Iron was used for the shortest period of time of any building material and few iron bridges have escaped replacement, yet the material itself was a significant advance in strength over wood, and it became the standard for bridges until the advantages of steel were accepted.

Lover's Leap (1895) was one of the last bridges built by the Berlin Company. The Berlin Company built hundreds of highway bridges and was one of a myriad of pre-fabricating companies. Not only was it the last holdout against steel as a construction material, it was the most imaginative of iron bridge builders. At that time, aggressive marketing was necessary to secure from wary selectmen the contract for a bridge. Each company held a patent on a particular kind of truss, column, etc. which supposedly made its bridge superior. It was thought (mistakenly) that composite bridges combining features from arch, truss and suspension designs were inherently better. Only the Berlin Company managed to combine all three principles, however. Lest the subtleties of their patented "parabolic truss" be lost on rural customers, Berlin salesmen arrived with cardboard models of their bridges and competing designs, the latter collapsing in the course of the demonstration. Bridge-building in this era depended on salesmanship, not science. Of course, relatively speaking, quite a few of the Berlin Company's bridges are still in place.

In the second half of the nineteenth century, iron bridges became an integral part of the American landscape, even more than covered bridges had been. John Roebling, designer of the Brooklyn Bridge, explained the aesthetic of iron bridges:

The present age is emphatically an age of usefulness. The useful goes before the ornamental. No matter what may be charged against the material tendencies of the present age, it is through material advancements alone that a higher spiritual culture of the masses can be attained.¹

Lover's Leap Bridge embodies this principle. The bridge is bluntly honest and creates through its graceful chords and slender members a light, floating impression, expressing and made possible by the inherent strength of the iron. The attenuated ornamental ironwork merely reinforces the overall effect. The functionalism of Lover's Leap Bridge is not at odds with the rest of Victorian architecture: it is a product of the same optimistic and moralistic aesthetic.
